

Standard Test Method for Hydroquinone in Vinyl Acetate¹

This standard is issued under the fixed designation D2193; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope*

1.1 This test method covers the determination of hydroquinone in the range from 1 to 20 ppm in refined, commercially available, vinyl acetate.

1.2 For purposes of determining conformance of an observed or a calculated value using this test method to relevant specifications, test result(s) shall be rounded off “to the nearest unit” in the last right-hand digit used in expressing the specification limit, in accordance with Practice E29.

1.3 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

1.5 For hazard information and guidance, see the supplier’s Material Safety Data Sheet.

E29 Practice for Using Significant Digits in Test Data to Determine Conformance with Specifications

3. Summary of Test Method

3.1 The vinyl acetate is evaporated at room temperature in a stream of inert gas or clean air to minimize the loss of hydroquinone by evaporation. The hydroquinone is dissolved in water and titrated with dilute standardized ceric acid sulfate using diphenylamine as indicator.

¹ This test method is under the jurisdiction of ASTM Committee D01 on Paint and Related Coatings, Materials, and Applications and is the direct responsibility of Subcommittee D01.35 on Solvents, Plasticizers, and Chemical Intermediates.

Current edition approved June 1, 2012. Published July 2012. Originally approved in 1963. Last previous edition approved in 2006 as D2193 – 06. DOI: 10.1520/D2193-06R12.

4. Significance and Use

4.1 This test method provides a measurement of inhibitor level in vinyl acetate. The results of these measurements can be used for specification acceptance.

5. Apparatus

5.1 *Buret*, 25-mL, graduated in 0.1-mL subdivisions.

5.2 *Beakers*, 50 and 600-mL capacity.

5.3 *Volumetric Flask*, 1000-mL capacity.

5.4 *Erlenmeyer Flasks*, 100 and 250-mL capacity.

5.5 *Nitrogen Cylinder*, or source of clean air.

5.6 *Pipets*, 10 and 50-mL capacity.

6. Reagents

6.1 *Purity of Reagents*—Reagent grade chemicals shall be used in all tests. Unless otherwise indicated, it is intended that all reagents shall conform to the specifications of the Committee on Analytical Reagents of the American Chemical Society, where such specifications are available.³ Other grades may be used provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lessening the accuracy of the determination.

6.2 *Purity of Water*—Unless otherwise indicated, references to water shall be understood to mean reagent water conforming to Type IV of Specification D1193.

6.3 *Ceric Acid Sulfate, Standard Solution (0.002 N)*—Dissolve 1.096 g of ceric ammonium nitrate ((NH₄)₂-Ce(NO₃)₆) in 28.0 mL of concentrated sulfuric acid (H₂SO₄, sp gr 1.84) contained in a 50-mL beaker. Slowly pour the ceric solution, while stirring, into 200 mL of water contained in a 600-mL beaker. When solution is complete, transfer this mixture to a 1000-mL volumetric flask and dilute to the mark with water.

³ *Reagent Chemicals, American Chemical Society Specifications*, American Chemical Society, Washington, DC. For suggestions on the testing of reagents not listed by the American Chemical Society, see *Analar Standards for Laboratory Chemicals*, BDH Ltd., Poole, Dorset, U.K., and the *United States Pharmacopeia and National Formulary*, U.S. Pharmacopeial Convention, Inc. (USPC), Rockville, MD.

*A Summary of Changes section appears at the end of this standard

6.4 *Diphenylamine Indicator Solution*—Dissolve 0.1 g of diphenylamine in 100 mL of H₂SO₄ (sp gr 1.84) and store this solution in a brown glass bottle.

6.5 *Hydroquinone Standard*—Dissolve 200.0 mg of hydroquinone, weighed to the nearest 0.1 mg, in water and dilute to 1000.0 mL in a volumetric flask. This solution is unstable and should be discarded after 1 week of normal use.

7. Standardization

7.1 Pipet 10-mL portions of the hydroquinone standard (see 6.5) into each of two 100-mL Erlenmeyer flasks. Add 3 drops of diphenylamine indicator solution to each flask. Using a 25-mL buret, titrate the contents of each flask with ceric acid sulfate solution to a faint blue end point that is permanent for 15 s. The titrations should be approximately 20 mL and should agree within 0.5 mL. Average the two values and use in the calculations (Section 9).

8. Procedure

8.1 Pipet 50 mL of the vinyl acetate sample into each of two 250-mL flasks.

8.2 Evaporate the specimens at room temperature by passing a stream of cylinder nitrogen gas or clean air into the flasks. Bench-line air should be passed through a fiberglass filter before entering the specimen flasks. Maintain the flow of gas just short of a level causing splattering of the specimen. That part of the delivery tube in the flask must be of metal, glass, or an inert plastic, such as polyethylene or polytetrafluoroethylene (PTFE).

8.3 After complete evaporation, which requires 45 to 60 min, remove the gas stream and dissolve the hydroquinone in 25 mL of water.

8.4 Add 3 drops of diphenylamine indicator solution to each flask using the same dropper as in the reagent standardization. Titrate each solution with the ceric acid sulfate reagent to a light blue end point that is permanent for 15 s.

9. Calculation

9.1 Calculate the parts per million of hydroquinone, H , in the sample as follows:

$$H = [(V \times F)/S] \times 1000 \quad (1)$$

where:

V = millilitres of ceric acid sulfate reagent required for titration of the specimen, (see 8.4),

F = factor (Section 7) = milligrams of hydroquinone in 10-mL aliquot/average millilitres of ceric acid sulfate reagent, and

S = grams of sample used = 50 × specific gravity.

10. Report

10.1 Report the concentration of hydroquinone to the nearest 0.1 ppm.

11. Precision and Bias

11.1 The following criteria should be used for judging the acceptability of results at the 95 % confidence level:

11.1.1 *Repeatability*—Two results, each the mean of duplicate determinations, obtained by the same analyst should be considered suspect if they differ by more than 0.3 ppm.

11.1.2 *Reproducibility*—Two results, each the mean of duplicate determinations, obtained by analysts in different laboratories should be considered suspect if they differ by more than 1.0 ppm.

NOTE 1—The preceding precision statements are based upon an interlaboratory study on two samples of vinyl acetate containing 4.6 and 15.3 ppm hydroquinone. Each sample was analyzed in duplicate on two different days by one analyst in each of five different laboratories.

11.2 *Bias*—This bias of this test method has not been determined because there is no appropriate standard available.

12. Keywords

12.1 HQ; hydroquinone; vinyl acetate

SUMMARY OF CHANGES

Committee D01.35 has identified the location of selected changes to this standard since the last issue (D2193 - 97 (2001)) that may impact the use of this standard. (Approved June 1, 2006.)

(1) Added reference to Practice E29 in the Scope section.

(2) Added Practice E29 to list of Referenced Documents.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
