

Designation: D5721 - 08 (Reapproved 2013)

Standard Practice for Air-Oven Aging of Polyolefin Geomembranes¹

This standard is issued under the fixed designation D5721; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

- 1.1 This practice covers a means for estimating the resistance of polyolefin geomembranes to thermal aging in the presence of air. Only the procedure for heat exposure is specified, not the test method or specimen. The effect of heat on any particular property may be determined by selection of the appropriate test method and specimen.
- 1.2 This practice should be used as a guide to compare thermal aging characteristics of materials as measured by the change in some property of interest. This practice does not predict thermal aging characteristics where interactions between stress, environment, temperature, and time control failure.
- 1.3 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.
- 1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2.1 ASTM Standards:²

D618 Practice for Conditioning Plastics for Testing

D638 Test Method for Tensile Properties of Plastics

D746 Test Method for Brittleness Temperature of Plastics and Elastomers by Impact

D1238 Test Method for Melt Flow Rates of Thermoplastics by Extrusion Plastometer

D1505 Test Method for Density of Plastics by the Density-Gradient Technique

D1525 Test Method for Vicat Softening Temperature of Plastics

D1790 Test Method for Brittleness Temperature of Plastic Sheeting by Impact

D1870 Practice for Elevated Temperature Aging Using a Tubular Oven (Withdrawn 1998)³

D3045 Practice for Heat Aging of Plastics Without Load D4439 Terminology for Geosynthetics

E145 Specification for Gravity-Convection and Forced-Ventilation Ovens

F412 Terminology Relating to Plastic Piping Systems

3. Terminology

- 3.1 Definitions:
- 3.1.1 For definitions of general terms used in this standard, refer to Terminology D4439.
- 3.1.2 *aging*, *n*—the process of exposing materials to an environment for an interval of time.
- 3.1.3 *polyolefin*, n—a polymer prepared by the polymerization of an olefin(s) as the sole monomer(s). (F412)
- 3.1.4 *Vicat softening point*—the temperature at which a flat-ended needle of 1 mm² circular cross section will penetrate a thermoplastic specimen to a depth of 1 mm under a specified load using a selected uniform rate of temperature rise. (D1525)

4. Significance and Use

- 4.1 Under the severe conditions of this test, the specimens undergo degradation at a rate that is a function of the thermal endurance of the geomembrane under examination.
- 4.2 The elevated temperature for this practice should represent conditions that are sufficiently severe to induce failure of polyolefin geomembranes within an abbreviated period of time
- 4.3 The rate of change of a particular property as a function of temperature may be evaluated using the temperatures and times outlined in Practice D3045.
- 4.4 Any correlation between this practice and natural life of these materials must be determined for the particular application in which the materials are to be used.
- 4.5 Air-oven aging can be used to evaluate and compare the performance of various heat stabilizer packages.

¹ This practice is under the jurisdiction of ASTM Committee D35 on Geosynthetics and is the direct responsibility of Subcommittee D35.02 on Endurance Properties.

Current edition approved May 1, 2013. Published May 2013. Originally approved in 1995. Last previous edition approved in 2008 as D5721–08. DOI: 10.1520/D5721-08R13.

5. Apparatus

5.1 *Oven*—A controlled, forced–ventilation oven with substantial fresh air intake is recommended. Oven apparatus shall be in accordance with Type 11B in Specification E145.

Note 1—Cross contamination has been known to occur in rubber products. It is not known if it can occur in semi-crystalline thermoplastics. When it is necessary to avoid contamination among specimens or materials, a tubular oven method such as Practice D1870 may be desirable.

5.2 Temperature Measuring Device—A thermocouple or thermometer adequate to cover the range being tested and accurate to at least ± 0.5 °C.

6. Sampling

6.1 Sampling shall be in accordance with the ASTM test methods for the specific properties to be determined.

7. Conditioning

- 7.1 Conduct initial tests in the standard laboratory atmosphere as specified in Practice D618, and with specimens conditioned in accordance with the requirements of the ASTM test method for determining the specific property or properties required.
- 7.2 When required, conditioning of specimens following exposure at elevated temperature and prior to testing, unless otherwise specified, shall be in accordance with Practice D618.

8. Procedure

- 8.1 Allow the oven to equilibrate at the test temperature. The temperature shall be below the Vicat softening point of the material
- 8.2 Suspend the specimens for exposure below an oven shelf in a way to maintain a distance of at least 20 mm between specimens and to allow for the entire shelf with specimens to be removed. Age for the specified time and temperature.

Note 2—Certain metals are known to affect the thermal endurance of some polyolefins. Therefore, direct contact of the specimens with metal shall be minimized.

- 8.3 Inspect the specimens weekly to ensure that the specimens have remained properly mounted. Note any visual changes of the specimens.
- 8.4 Rotate the shelves from top to bottom and from front to back once a week to ensure even exposure.

8.5 At the end of an aging interval, remove a set of specimens and allow them to cool. Test the specimens for the selected property in accordance with the appropriate test method, including provisions for conditioning.

9. Potential Tests

- 9.1 The following properties may be appropriate for evaluating the effects of oven exposure:
 - 9.1.1 Tensile properties (see Test Method D638),
 - 9.1.2 Melt flow index (see Test Method D1238),
 - 9.1.3 Density (see Test Method D1505),
 - 9.1.4 Tensile impact (see Test Method D746), and
 - 9.1.5 Brittleness temperature (see Test Method D1790).

10. Calculation

10.1 Express the results of the aging test as a percentage of the change in each physical property, calculated as follows:

change,
$$\% = \left[(A - O)/O \right] \times 100$$
 (1)

where:

O = original value, and

A =value after aging.

Note 3—Since the values of some properties may increase as a function of exposure time, a positive change shows an increase while a negative change shows a decrease in the property value.

10.2 Alternatively, the time to failure can be determined based on a failure criteria such as brittleness, or on a percentage change of a given property.

11. Report

- 11.1 Report the following information:
- 11.1.1 Geomembrane type, thickness and specimen preparation procedure,
- 11.1.2 Pre-conditioning and post-conditioning procedures followed,
 - 11.1.3 Test methods utilized for evaluation of each property,
- 11.1.4 Observations of any visible changes in the test specimens,
 - 11.1.5 Type of oven used,
 - 11.1.6 Exposure temperature and times used,
- 11.1.7 Mean and standard deviation for results calculated according to 10.1, and
- 11.1.8 Mean time to failure and failure criteria for results generated in 10.2.

12. Keywords

12.1 geomembrane; oven aging; polyolefin

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
