# Geotechnical investigation and testing — Laboratory testing of soil

## Part 2: Determination of bulk density

**bsi.**

...making excellence a habit.™

### National foreword

This British Standard is the UK implementation of EN ISO 17892-2:2014. It partially supersedes BS 1377-2:1990, specifically clause 7.

The UK participation in its preparation was entrusted to Technical Committee B/526/3, Site investigation and ground testing.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

This European Standard was approved by CEN on 18 October 2014.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

## Foreword

This document (EN ISO 17892-2:2014) has been prepared by Technical Committee ISO/TC 182 "Geotechnics" in collaboration Technical Committee CEN/TC 341 "Geotechnical Investigation and Testing" the secretariat of which is held by BSI.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by June 2015, and conflicting national standards shall be withdrawn at the latest by June 2015.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document supersedes CEN ISO/TS 17892-2:2004.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

### Endorsement notice

The text of ISO 17892-2:2014 has been approved by CEN as EN ISO 17892-2:2014 without any modification.

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2. [www.iso.org/directives](http://www.iso.org/directives)

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received. [www.iso.org/patents](http://www.iso.org/patents)

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT), see the following URL: [Foreword - Supplementary information](#)

ISO 17892-2 was prepared by the European Committee for Standardization (CEN) Technical Committee CEN/TC 341, *Geotechnical investigation and testing*, in collaboration with Technical Committee ISO/TC 182, *Geotechnics*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This first edition of ISO 17892-2 cancels and replaces ISO/TS 17892-2:2004, which has been technically revised. It also incorporates the Technical Corrigendum ISO/TS 17892-2:2004/Cor 1:2006.

ISO 17892 consists of the following parts, under the general title "*Geotechnical investigation and testing — Laboratory testing of soil*":

- *Part 1: Determination of water content*
- *Part 2: Determination of bulk density*
- *Part 3: Determination of particle density*
- *Part 4: Determination of particle size distribution*
- *Part 5: Incremental loading oedometer test*
- *Part 6: Fall cone test*
- *Part 7: Unconfined compression test on fine-grained soils*
- *Part 8: Unconsolidated undrained triaxial test*
- *Part 9: Consolidated triaxial compression tests on water-saturated soils*
- *Part 10: Direct shear tests*
- *Part 11: Determination of permeability by constant and falling head*
- *Part 12: Determination of Atterberg limits*

## Introduction

This document covers areas in the international field of geotechnical engineering never previously standardised internationally. It is intended that this document presents broad good practice throughout the world and significant differences with national documents is not anticipated. It is based on international practice (see Reference [1]).

# Geotechnical investigation and testing — Laboratory testing of soil —

## Part 2: Determination of bulk density

### 1 Scope

This International Standard specifies three methods for the determination of the bulk density of soils, comprising:

- a) linear measurement method;
- b) immersion in fluid method;
- c) fluid displacement method.

This International Standard is applicable to the laboratory determination of the bulk density of soil within the scope of geotechnical investigations.

The linear measurement method is suitable for the determination of the bulk density of a specimen of soil of regular shape, including specimens prepared for other tests. The specimens used are either rectangular prisms or cylinders with circular cross sections.

The immersion in fluid method covers the determination of the bulk density of a specimen of natural or compacted soil by measuring its mass in air and its apparent mass when suspended in fluid. The method may be used when lumps of material of suitable size can be obtained.

The fluid displacement method covers the determination of the bulk density of a specimen of soil by measuring its mass in air and the mass of fluid displaced by immersion. The method may be used when lumps of material of suitable size can be obtained.

If the immersion in fluid method or fluid displacement method is used, and if the fluid is likely to penetrate into the specimen (eg water) the specimen should be coated before testing to prevent fluid penetration.

The bulk density of a soil is useful in the determination of the *in situ* overburden stress as a function of depth.

If required, the dry density of a specimen may be calculated from the bulk density and the water content, if known.

**NOTE** This International Standard fulfils the requirements of the determination of the bulk density of soils for geotechnical investigation and testing in accordance with EN 1997-1 and EN 1997-2.

### 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 17892-1, *Geotechnical investigation and testing — Laboratory testing of soil — Part 1: Determination of water content*

ISO 14688-1, *Geotechnical investigation and testing — Identification and classification of soil — Part 1: Identification and description*

### 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

#### 3.1 bulk density

$\rho$   
mass of soil per unit volume of the material, including any water or gas it contains

#### 3.2 dry density

$\rho_d$   
mass of oven-dried soil per unit volume of the material

### 4 Equipment

#### 4.1 Linear measurement method

The following items are necessary for the linear measurement method:

**4.1.1 Cutting and trimming tools** (e.g. a sharp knife, wire saw, spatula, cutting ring, soil lathe).

**4.1.2 Steel straight edge**, with a maximum deviation from straight of 0,1 % of its length.

**4.1.3 Try-square or a jig** (e.g. a mitre box) or **split mould**, to ensure that flatness shall be accurate to within 0,5 % of each dimension and that right-angles are within 0,5° of true.

**4.1.4 Callipers**, either analogue or digital, readable to 0,1 mm or 0,1 % of the measured length, whichever value is the greater.

**4.1.5 Balance**, accurate to 0,01 g or 0,1 % of the weighed mass, whichever value is the greater.

#### 4.2 Immersion in fluid method

The following items are necessary for the immersion measurement method:

**4.2.1 Container of a suitable size.**

**4.2.2 Balance**, accurate to 0,01 g or 0,1 % of the weighed mass, whichever is the greater.

**4.2.3 Thermometer or temperature measuring device**, accurate to 1°C.

**4.2.4 Cradle and supporting frame**, similar in principle to that shown in [Figure 1](#) which, with the frame attached to the scoop or platform of the balance, can support the cradle below the balance.

**4.2.5 Materials: modelling clay or putty and a suitable coating**, to prevent fluid penetration (if used, e.g. paraffin wax).

**4.2.6 Equipment for melting wax** (if used), preferably electrically heated and thermostatically controlled.

#### 4.3 Fluid displacement method

The following items are necessary for the fluid displacement method:

**4.3.1 Rigid container with a siphon tube.** The container shall be large enough to accommodate the specimen.

**4.3.2 Container,** to collect the fluid siphoning over from the specimen container.

**4.3.3 Balance,** accurate to 0,01 g or 0,1 % of the weighed mass, whichever value is the greater.

**4.3.4 Thermometer or temperature measuring device,** accurate to 1°C.

**4.3.5 Materials: modelling clay or putty and a suitable coating,** to prevent fluid penetration (if used, e.g. paraffin wax).

**4.3.6 Equipment for melting wax** (if used), preferably electrically heated and thermostatically controlled.

Alternatively, the equipment described in [4.2](#) can be used. In such case, a correction for the uplift for the cradle shall be included in the calculations.

## 5 Test procedure

Test specimens should be at least 50 cm<sup>3</sup> in volume, and preferably significantly larger.

**NOTE** If smaller specimens are tested they may be less representative of the material as a whole and the result may not be as accurate as suggested by the reported value.

### 5.1 Linear measurement method

#### 5.1.1 General

The principle of the method is to weigh a specimen of known volume. Three procedures are specified for preparing the specimen. Other methods are also accepted if they provide representative specimens of regular shape.

#### 5.1.2 Specimen from block sample

**5.1.2.1** At least 10 mm from the outside face of the block sample shall be cut away and an approximately rectangular prism of soil slightly larger than the final dimensions of the specimen shall be formed. If the specimen is to be used for some other test, its shape and dimensions shall also be appropriate for that test.

**5.1.2.2** For a rectangular prism specimen the faces shall be made plane and parallel by careful trimming and checking with a straight edge and try-square or other jig. The other four faces of the prism shall be trimmed so that they are mutually perpendicular and at right angles to the end faces.

**5.1.2.3** For a cylindrical specimen the specimen shall be placed in a soil lathe and the excess soil removed with vertical cuts in thin layers. The specimen shall be rotated between each cut until a cylindrical specimen is produced. The specimen shall not be trimmed while it is being rotated. After trimming, the specimen shall be removed from the lathe. It shall be cut to the required length and the ends shall be made plane and normal to the specimen axis.

#### 5.1.3 Specimen from sample tube

**5.1.3.1** If the specimen is likely to deform on removal from the tube, its volume should be determined by measurement according to [5.1.5.4](#).

**5.1.3.2** For samples that are extruded from a sample tube, measurements can be made directly on the sample. Remove the caps, wax or other sealing material from each end of the sample tube. Extrude the sample and trim surplus soil from the ends of the specimen until flat and perpendicular to the specimen axis. The measurements should then be made as soon as possible on the extruded sample.

#### **5.1.4 Cylindrical specimen of smaller diameter than the sample tube**

Either the sample may be extruded from the sample tube through a cylindrical cutter or a cylindrical cutter may be pushed into the sample. The sample tube or specimen cutter shall be pushed steadily at constant speed into the soil. The specimen shall be trimmed further to make the ends flat and perpendicular to the specimen axis, as necessary.

#### **5.1.5 Measurements**

**5.1.5.1** The trimmed specimen shall be weighed to the nearest 0,01 g or 0,1 % of the total mass, whichever is the greater ( $m$ ).

**5.1.5.2** For a rectangular prism specimen, the lengths of the specimen shall be measured in at least three positions in each dimension to the nearest 0,1 mm or 0,1 % of the dimension being measured, whichever is the greater.

**5.1.5.3** For a cylindrical specimen, the diameter shall be measured in two perpendicular directions, at each end and near the middle, to the nearest 0,1 mm or 0,1 % of the dimension being measured, whichever is the greater. The length shall be measured along three lines spaced at about 120° around the circumference, to the nearest 0,1 mm or 0,1 % of the dimension being measured, whichever is the greater.

**5.1.5.4** If the specimen is likely to deform on removal from the tube its volume should be determined by measuring the inside diameter and the length of the sample tube. If the tube is not full, allowance should be made for any missing sample. Each length shall be measured to the nearest 0,1 mm or 0,1 % of the dimension being measured, whichever is the greater. The mass of the specimen should then be determined by difference, by weighing the tube with the specimen and the clean tube after extrusion of the specimen.

**5.1.5.5** If the dry density is required, the water content of a representative portion of the sample shall be determined in accordance with ISO 17892-1.

### **5.2 Immersion in fluid method**

#### **5.2.1 Equipment preparation**

**5.2.1.1** The balance shall be supported with the platform over the container and with sufficient clear space between the underside of the supports and the top of the container. A suitable arrangement is shown in [Figure 1](#).

### Key

- 1 supporting frame
- 2 cradle
- 3 specimen (with coating if used)
- 4 balance
- 5 fluid container

**Figure 1 — Method of determining density by immersion in fluid**

**5.2.1.2** The cradle, supporting frame and fluid container shall be adjusted so that the cradle is suspended in the fluid without touching either the bottom or the sides of the container. The container shall be filled with fluid to a depth so that the specimen to be tested shall be completely submerged when on the cradle.

**5.2.1.3** Set the balance reading to zero or otherwise record the indicated reading.

### 5.2.2 Specimen preparation and measurements

**5.2.2.1** The soil specimen shall be trimmed if necessary.

**5.2.2.2** The specimen shall be weighed to the nearest 0,01 g or 0,1 % of the mass whichever is the greater ( $m$ ).

**5.2.2.3** All the surface voids of the specimen shall be filled with a material which is insoluble in the fluid and the specimen shall be re-weighed to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m_f$ ). Care should be taken to fill only natural air voids present in the sample before sampling (generally with wax or putty) and not the cavities resulting from loss of coarse particles during collection

and preparation of the specimen. In filling the voids the material used should be trimmed level with the surface of the specimen.

**5.2.2.4** The specimen shall be coated completely if the chosen fluid can penetrate into the specimen. For example, if coating with wax the specimen should be repeatedly dipped into molten wax, allowing each layer of wax to solidify before further dipping. To avoid shrinking and cracking of the wax, it should be only just molten when applied.

**5.2.2.5** Coating of the specimen should be carried out very carefully ensuring, for example, that air bubbles are not formed under the coating.

**5.2.2.6** Once completely coated, the specimen shall be allowed to cool, if necessary, and shall be re-weighed to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m_c$ ).

**5.2.2.7** The specimen shall be placed in the cradle suspended from the supporting frame attached to the balance. The specimen shall be placed in the fluid taking care that no air bubbles are trapped underneath the specimen. Adjust the fluid level so that the specimen is completely submerged and so that the cradle is at about the same depth in the fluid as in [5.2.1.2](#).

**5.2.2.8** Record the temperature of the immersion fluid.

**5.2.2.9** The buoyant mass of the specimen shall be measured while suspended in fluid to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m_g$ ).

**5.2.2.10** If the dry density is required, the specimen shall be removed from the cradle, allowed to surface dry or otherwise have excess surface fluid removed, and then be broken open. A portion of the specimen shall be taken which is completely free from coating, wax, modelling clay or putty and its water content shall be determined in accordance with ISO 17892-1.

## 5.3 Fluid displacement method

### 5.3.1 Equipment preparation

**5.3.1.1** The general arrangement of the equipment is shown in [Figure 2](#).

**5.3.1.2** Stand the specimen container on a level base and fill with fluid until the level of the liquid is well above the siphon tube. Allow excess fluid to siphon to waste.

**5.3.1.3** The receiving container shall be weighed to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m_1$ ) and it shall then be placed below the siphon outlet.

**Key**

- 1 displaced fluid level
- 2 final fluid level
- 3 siphon tube
- 4 tap or clip
- 5 specimen (with coating if used)
- 6 displaced fluid

**Figure 2 — Method of determining density by fluid displacement**

**5.3.2 Specimen preparation and measurements**

**5.3.2.1** The soil specimen shall be trimmed if necessary.

**5.3.2.2** The specimen shall be weighed to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m$ ).

**5.3.2.3** All the surface voids of the specimen shall be filled with a material which is insoluble in the fluid and the specimen shall be re-weighed to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m_f$ ). Care should be taken to fill only natural air voids present in the sample before sampling (generally with wax or putty) and not the cavities resulting from loss of coarse particles during collection and preparation of the specimen. In filling the voids the material used should be trimmed level with the surface of the specimen.

**5.3.2.4** The specimen shall be coated completely if the chosen fluid can penetrate into the specimen. For example, if coating with wax, the specimen shall be coated completely by repeating dipping in molten wax, allowing each layer of wax to solidify before further dipping. To avoid shrinking and cracking of the wax, it should be only just molten when applied.

**5.3.2.5** Coating of the specimen should be carried out very carefully ensuring, for example, that air bubbles are not formed under the coating.

**5.3.2.6** Once completely coated, the specimen shall be allowed to cool, if necessary, and shall be re-weighed to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m_c$ ).

**5.3.2.7** The specimen shall be lowered carefully into the container so that the whole specimen is submerged below the inlet to the siphon. When the specimen is placed in the fluid in the container care should be taken to see that no air bubbles are trapped underneath the specimen.

**5.3.2.8** Record the temperature of the fluid that the sample is placed into.

**5.3.2.9** The tap or clip on the siphon outlet tube shall be opened, allowing the displaced fluid to siphon over into the receiving container. The receiving container and fluid shall be weighed to the nearest 0,01 g or 0,1 % of the mass, whichever is the greater ( $m_2$ ).

**5.3.2.10** If the dry density is required, the specimen shall be removed from the cradle, allowed to surface dry or otherwise have excess surface fluid removed, and then be broken open. A portion of the specimen shall be taken which is completely free from coating, wax, modelling clay or putty and its water content shall be determined in accordance with ISO 17892-1.

## 6 Test results

### 6.1 Volume

#### 6.1.1 Linear Method

Calculate the average of the measurements of each dimension of the sample (in millimetres).

For rectangular prisms calculate the volume of the test specimen  $V$  from Formula (1):

$$V = L \times W \times H \times 10^{-9} \text{ m}^3 \quad (1)$$

where

$L$  is the average of the measurements of the length of one dimension (mm);

$W$  is the average of the measurements of the length of the second dimension (mm);

$H$  is the average of the measurements of the length of the remaining dimension (mm).

For cylindrical specimens, calculate the volume  $V$  from Formula (2):

$$V = \left[ \pi \times \frac{d^2}{4} \times L \right] \times 10^{-9} \text{ m}^3 \quad (2)$$

where

$d$  is the average of the six measurements of the diameter of the specimen (mm);

$L$  is the average of the three measurements of the length of the specimen (mm).

### 6.1.2 Immersion in fluid method

The volume of the test specimen  $V$  shall be calculated from Formula (3):

$$V = \left[ \frac{(m_c - m_g)}{\rho_{fl}} - \frac{(m_c - m_f)}{\rho_p} \right] \times 10^{-6} \text{ m}^3 \quad (3)$$

where

$m_c$  is the mass of the immersed specimen (including the mass of coating if used) (g);

$m_g$  is the apparent mass of specimen (and coating if used) when suspended in the fluid (g);

$m_f$  is the mass of specimen after making up surface voids with filler (excluding coating) (g);

$\rho_{fl}$  is the density of the immersion fluid at the test temperature (Mg/m<sup>3</sup>);

$\rho_p$  is the density of the coating (Mg/m<sup>3</sup>).

NOTE The quoted unit of Mg/m<sup>3</sup> for the density of the coating and of the immersion fluid has the same numerical value as the density expressed in g/cm<sup>3</sup>.

### 6.1.3 Fluid displacement method

The volume of the test specimen  $V$  shall be calculated from Formula (4):

$$V = \left[ \frac{(m_2 - m_1)}{\rho_{fl}} - \frac{(m_c - m_f)}{\rho_p} \right] \times 10^{-6} \text{ m}^3 \quad (4)$$

where

$m_1$  is the mass of the fluid container (g);

$m_2$  is the mass of the fluid container and fluid siphoned into it (g);

$m_c$  is the mass of specimen after coating (g);

$m_f$  is the mass of specimen after filling surface voids (g);

$\rho_{fl}$  is the density of fluid at the test temperature (Mg/m<sup>3</sup>);

$\rho_p$  is the density of coating material (Mg/m<sup>3</sup>).

## 6.2 Bulk density

The bulk density,  $\rho$ , shall be calculated from Formula (5):

$$\rho = \frac{m}{V} \times 10^{-6} \text{ Mg/m}^3 \quad (5)$$

where

$m$  is the specimen mass (g);

$V$  is the volume of the specimen (m<sup>3</sup>).

### 6.3 Dry density

If required, the dry density of the specimen  $\rho_d$  shall be calculated from Formula (6):

$$\rho_d = \frac{\rho}{1+(w/100)} \text{ Mg/m}^3 \quad (6)$$

where  $w$  is the water content of the soil, expressed as a percentage of dry mass.

NOTE The term unit weight is often used and is calculated by multiplying the density by the acceleration due to gravity.

## 7 Test report

The test report shall affirm that the test was carried out in accordance with this document and shall include the following information:

- a) method of test used;
- b) identification of the specimen tested, e.g. by borehole number, sample number and sample depth and any other relevant details required, e.g. depth of specimen within a sample, method of sample selection if relevant;
- c) a visual description of the specimen including any observed features noted after testing, following the principles in ISO 14688-1;
- d) bulk density expressed to two decimal places;
- e) if required, the dry density expressed to two decimal places and the water content of the soil reported in accordance with ISO 17892-1;
- f) specimen size if less than 50 cm<sup>3</sup> and any deviation from this specified procedure.

## Annex A (normative)

# Calibration, maintenance and checks

### A.1 General requirements

All measurement equipment used in this standard shall be calibrated periodically, its performance shall be checked where required at intervals, and it shall be operated in a controlled environment if so specified. This Annex defines these requirements for this method.

If calibration of measurement equipment is carried out by a third party it shall be carried out by an accredited calibration laboratory. The certification shall show traceability to recognized national or international standards of measurement.

Where calibration of test measuring equipment is carried out in-house the laboratory shall hold appropriate reference standards or instruments that are used solely for calibration purposes. These should be calibrated by an accredited calibration laboratory with certification requirements as above. When not in use reference measurement equipment should be retained securely in a suitable environment separate from working standards or instruments. Reference standards and instruments shall be at least as accurate as the working device so that the desired accuracy of test measurement is achieved.

In house calibration procedures shall be documented, shall only be performed by approved persons and records of such calibrations, and of performance checks, shall be retained on file.

Notwithstanding the required calibration or check intervals in this Annex, whenever any item of reference equipment or test measurement equipment has been mishandled, repaired, dismantled, adjusted or overhauled it shall be recalibrated before further use.

All calibrated equipment shall be used only within the range for which it has been calibrated.

### A.2 Environmental conditions

There are no specific environmental conditions applicable to the execution of this test method.

### A.3 Equipment

#### A.3.1 Balances

Balances shall be calibrated over their working range, using certified reference weights, at least once a year. Reference weights shall be appropriate to the category of balance being calibrated, and shall have a tolerance (maximum permissible error) better than the resolution of the balance to be calibrated. Reference weights shall be calibrated when first brought into use and thereafter at least every two years.

Balances shall be checked on each day of use to confirm the zero point and to confirm the mass of a test item of known mass. The test item should not corrode or otherwise change mass with time, and should have a mass within the range 50 % to 80 % of the working range of the balance. The results of these checks shall be recorded. If the balance cannot be zeroed or the mass of the test weight is found to be outside the tolerance specified in [4.3](#), the balance shall be taken out of service until remedial action is complete.

### A.3.2 Thermometers

Reference thermometers complying with ISO 386 shall be calibrated or replaced at intervals not exceeding five years. All other liquid-in-glass thermometers shall be calibrated before first use and shall be re-calibrated or replaced at intervals not exceeding five years.

An ice point or another appropriate single point check of working thermometers shall be carried out six months after first being brought into use, then annually in addition to the five year calibration interval requirement.

If thermocouples are used for verifying oven temperatures, they shall be calibrated against a reference thermocouple, reference platinum resistance thermometer or reference liquid-in-glass thermometer before first use and thereafter at least once a year.

### A.3.3 Dimensional measuring instruments

Callipers shall be calibrated against reference gauge blocks or a reference calliper for both internal and external measurements. Reference gauge blocks shall be calibrated at least every five years. Reference and working callipers shall be calibrated at least every year.

### A.3.4 Tools to check dimensional requirements

Straight edge tools shall be checked visually on each day of use for defects, and the straightness shall be verified at least once a year by comparison with a reference straight edge. All other tools used to ensure dimensional requirements, e.g. try-squares, jigs, mitre-boxes, cutter or moulds, shall be verified at least annually to confirm their dimensions and angles.

## **Annex B** **(informative)**

### **Explanations**

Care should be taken to select the method most appropriate to the material to be tested, since incorrect results may be derived from a method which is not well suited to the particular type of soil.

Particular care should be exercised with partially saturated and swelling soils, because some test methods may allow a change in water content, and therefore bulk density, as a result of fluid penetration (e.g. in the immersion in fluid method, or fluid displacement method).

Where the linear measurement method is used, care should be taken to ensure that significant water content changes do not occur during trimming, for example due to evaporation.

The immersion in fluid method and the fluid displacement methods can be carried out quite satisfactorily on regular or irregular shaped specimens as long as lumps with re-entrant angles are avoided. As the accuracy of the test depends upon the size of the specimen, it is important that the specimen size is compatible with the capacity of the balance and of the container used.

# British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

## About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards-based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

## Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at [bsigroup.com/standards](http://bsigroup.com/standards) or contacting our Customer Services team or Knowledge Centre.

## Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at [bsigroup.com/shop](http://bsigroup.com/shop), where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

## Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to [bsigroup.com/subscriptions](http://bsigroup.com/subscriptions).

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

**PLUS** is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit [bsigroup.com/shop](http://bsigroup.com/shop).

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email [bsmusales@bsigroup.com](mailto:bsmusales@bsigroup.com).

## BSI Group Headquarters

389 Chiswick High Road London W4 4AL UK

## Revisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.

## Copyright

All the data, software and documentation set out in all British Standards and other BSI publications are the property of and copyrighted by BSI, or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use.
