

Flanges and their joints — Circular flanges for pipes, valves, fittings and accessories, Class designated —

Part 1: Steel flanges, NPS 1/2 to 24

The European Standard EN 1759-1:2004 has the status of a British Standard

ICS 23.040.60

National foreword

This British Standard is the official English language version of EN 1759-1:2004. It supersedes BS 1560-3.1:1989 which is withdrawn.

The UK participation in its preparation was entrusted to Technical Committee PSE/15, Flanges, which has the responsibility to:

- aid enquirers to understand the text;
- present to the responsible international/European committee any enquiries on the interpretation, or proposals for change, and keep the UK interests informed;
- monitor related international and European developments and promulgate them in the UK.

A list of organizations represented on this committee can be obtained on request to its secretary.

Cross-references

The British Standards which implement international or European publications referred to in this document may be found in the *BSI Catalogue* under the section entitled "International Standards Correspondence Index", or by using the "Search" facility of the *BSI Electronic Catalogue* or of British Standards Online.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Compliance with a British Standard does not of itself confer immunity from legal obligations.

This British Standard was published under the authority of the Standards Policy and Strategy Committee on 30 November 2004

Summary of pages

This document comprises a front cover, an inside front cover, the EN title page, pages 2 to 74, an inside back cover and a back cover.

This European Standard was approved by CEN on 30 September 2004.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

Foreword

This document (EN 1759-1:2004) has been prepared by Technical Committee CEN/TC 74 "Flanges and their joints" the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by May 2005, and conflicting national standards shall be withdrawn at the latest by May 2005.

EN 1759 consists of the following parts:

- Part 1: Steel flanges;
- Part 3: Copper alloy flanges¹;
- Part 4: Aluminium alloy flanges¹.

This document includes a Bibliography.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

¹ To be published

Introduction

When Technical Committee, CEN/TC 74, commenced its work of producing this European standard it took as its basis, the International Standard, ISO 7005-1, Steel flanges.

In taking this decision, CEN/TC 74, agreed that this standard would differ significantly from the ISO standard in respect of the following:

- a) Whereas ISO 7005-1 included in its scope both the original DIN based flanges and also the original ANSI/ASME based flanges, EN 1759-1 contains only the flanges with ANSI/ASME origin (ASME B16.5). CEN/TC 74 has produced a separate series of standards, EN 1092 Parts 1, 2, 3 and 4, dealing with the DIN based flanges in PN designations;
- b) In this standard, the flanges are Class designated (not PN designated as in the ISO standard) and those dimensions taken from ASME B16.5 are hard metricated.

Consequently, whilst the mating dimensions, the flange and facing types and designations are compatible with those given in ISO 7005-1, it is important to take account of the following differences which exist in EN 1759-1:

- 1) The use of inch bolting requires the use of suitable gaskets, not necessarily compatible with the gaskets used with ISO 7005-1 flanges (for metric bolts).
- 2) This standard specifies grades of ASTM steels similar to those specified in ISO 7005-1, but in addition permits the use of grades of European steels according to EN 1092-1;

1 Scope

This European Standard for a single system of flanges specifies requirements for circular steel flanges in Class designations Class 150 to Class 2 500 and nominal sizes from NPS ½ to NPS 24.

NOTE The relationship between nominal size (DN) and nominal size (NPS) is given for reference purposes in Tables 9 to 14.

This standard specifies the flange types and their facings, dimensions, tolerances, threading, bolt sizes, flange jointing face surface finish, marking, materials and pressure/temperature ratings.

This standard does not apply to flanges made from bar stock by turning, or to flanges of types 11, 12, 13, 14 and 15 made from plate material.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this European Standard, the following terms and definitions apply.

3.1

Class

alphanumeric designation used for reference purposes related to a combination of mechanical and dimensional characteristics of a component of a pipework system. It comprises the word Class followed by a dimensionless whole number

NOTE 1 The number following the word Class does not represent a measurable value and should not be used for calculation purposes except where specified in the relevant standard.

NOTE 2 The designation Class is not meaningful unless it is related to the relevant component standard number.

NOTE 3 It is intended that all components with the same Class and NPS (see below) designations should have the same mating dimensions for compatible flange types.

3.2

DN

see EN ISO 6708

3.3

NPS

alphanumeric designation of size for components of a pipework system, which is used for reference purposes. It comprises, for the purpose of Class designated flanges according to this standard, the letters NPS followed by a dimensionless number which is indirectly related to the physical size of the bore or outside diameter of the end connections

NOTE The number following the letters NPS does not represent a measurable value and should not be used for calculation purposes except where specified in the relevant standard.

3.4

maximum allowable pressure, *PS*

means the maximum pressure for which the equipment is designed, as specified by the equipment manufacturer

3.5

maximum allowable temperature, *TS*

means the maximum temperature for which the equipment is designed, as specified by the equipment manufacturer

4 Designation

4.1 General

Table 1 and Figure 1 show the flange types and their relevant type numbers. Flanges shall be denoted with "flange type" and "flange number".

Figure 2 shows flange facing types, which may be used with the flanges shown in Figure 1. Flange facings shall be denoted with "type" and the relevant symbol.

The range of NPS, applicable to each flange type and each Class designation shall be as given in Table 2.

4.2 Information to be supplied by the equipment manufacturer

The following information should be supplied by the equipment manufacturer in the enquiry and/or order.

Flanges and ancillary components in accordance with this standard shall be designated with the following:

- a) Designation, e.g. flange, lapped or collar;
- b) Number of this standard, EN 1759-1;
- c) Flange type number (see Table 1);
- d) Facing type number (see Figure 2);
- e) Nominal size (NPS or DN);
- f) Class designation followed by the appropriate number;
- g) The bore for weld-neck (type 11) and hubbed slip-on (type 12) flanges, if different from those specified in this standard (see notes to Tables of flange dimensions).
- h) Weld end preparation required (see Annex A);

- i) Either the symbol or the number or the grade of the material (see 5.1 and Tables 3a and 3b);
- j) Any heat treatment required
- k) Material certificate, if required (see 5.1.1);

EXAMPLE 1

Designation of a flange type 01 with facing type A of nominal size DN 400 and Class number 150, made of material of group 1.1

Flange EN 1759-1 / 01 / A/DN 400 / Class 150 / material group 1.1

EXAMPLE 2

Designation of a flange type 05 with facing type C of nominal size NPS 6 and Class number 600, made of material ASTM A105 with certificate 3.1B

Flange EN 1759-1 / 05 / C / NPS 6 / Class 600 / A105 / 3.1B

EXAMPLE 3

Designation of a flange type 11 with facing type B of nominal size DN 300 and Class number 900, bore B3 = 298 mm, made of material of group 6E0

Flange EN 1759-1 / 11 / B / DN 300 / Class 900 / 298 / material group 6E0

5 General requirements

5.1 Flange materials

5.1.1 General

Flanges shall be manufactured from materials given in Tables 3a and 3b. Flanges type 11, 12, 13, 14, 15 and 21 shall be made from forgings. Flanges type 21 shall be made from forgings or steel castings.

NOTE The materials given in Tables 3a and 3b are tabulated in groups having common pressure/temperature ratings as given in Tables 16 to 22.

The flange manufacturer shall provide documentation to ensure traceability of material. An equipment manufacturer may require a material certificate in accordance with EN 10204, which is suitable for the category of equipment to which the flange is fitted.

5.1.2 Non alloy steels

The carbon content by ladle analysis of the materials specified in Tables 3a and 3b shall not exceed 0,23 % for plate and for forgings and 0,25 % for castings.

The steel manufacturer shall ensure on a basis of regular production checks that the carbon equivalent (CEV) by cast analysis does not exceed 0,45 % where:

$$CEV = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

NOTE The above carbon equivalents do not apply to flange types 01, 05 and 21 manufactured from plate material.

5.2 Repairs

No repair welding shall be permitted without prior approval of the equipment manufacturer and when prohibited by the applicable material standard.

Where permitted, repair welding shall be carried out by a proven method and shall be in accordance with a written procedure.

Material repaired by welding shall be marked with the letter W following the specification number.

NOTE For approval of welding procedures, see EN ISO 15607. For approval of welders, see EN 287-1.

5.3 Bolting

5.3.1 General

Flanges shall be suitable for use with the nominal size and number of bolts specified in Tables 9 to 14 as appropriate.

The bolting shall be chosen according to the pressure, temperature, flange material and gasket so that the flanged joint remains tight under the expected operating conditions.

5.3.2 Selection of bolting

For selection of bolting, see EN 1515-1, for classification of bolting materials see prEN 1515-3 and Annex B.

Bolting of other materials should be chosen according the parameters above.

NOTE For use of metric bolting see Annex C.

5.4 Gaskets

The various gasket types, dimensions, design characteristics and materials used are not within the scope of this standard. Dimensions of gaskets are given in EN 12560 Parts 1 to 7.

5.5 Pressure/temperature (p/T) ratings

The pressure/temperature ratings of the flanges manufactured from the materials specified in Tables 3a and 3b shall be as given in Tables 16, 17, 18, 19, 20, 21 and 22 for the applicable materials, and shall not exceed the value of the Class shown.

NOTE 1 Linear interpolation is permitted for intermediate temperatures.

NOTE 2 The pressure/temperature ratings of flanges depend upon the properties of the materials specified in Tables 3a and 3b.

For determination of p/T ratings for EN materials see Annex D.

5.6 Dimensions

5.6.1 Flanges

The dimensions of flanges shall be as given in Tables 9 to 14, and as qualified by 5.8 and the notes to Tables 9 to 14, if appropriate. The diameter of shoulder, dimension G , may be varied from the given value (see note 2), which is a maximum limit.

NOTE 1 The equipment manufacturer should specify in the enquiry and/or order if dimensions of flanges are to be affected by 5.8 and/or the notes to Tables 9 to 14.

NOTE 2 The centre portion of the face of a blank flange (type 05) need not be machined provided that the diameter of the unmachined portion does not exceed the recommended shoulder diameter, G , given in Tables 9 to 14.

NOTE 3 A summary of the various types of flanges specified showing the nominal sizes applicable to each type and to each class is given in Table 2.

5.6.2 Hubs

The hubs of slip-on for welding (type 12) and threaded (type 13) flanges shall be either:

- a) parallel; or
- b) have a draft angle of not exceeding 7° on the outside surface for forging or casting purposes.

For details of the weld preparation for weld-neck flanges (type 11) see Annex A.

5.6.3 Threaded flanges

5.6.3.1 The threads of hubbed threaded flanges (type 13) shall be taper according to ASME/ANSI B1.20.1.

5.6.3.2 The thread shall be concentric with the axis of the flange and misalignments shall not exceed 5 mm per metre.

Class 150 flanges shall be manufactured without a counterbore, but to protect the thread they shall be chamfered to the major diameter of the thread at the hubbed side of the flange, at an angle between 30° and 50° with the axis of the thread. The chamfer shall be concentric with the thread and shall be included in the measurement of the thread length provided that the chamfer does not exceed one pitch in length.

Class 300, 600, 900, 1 500 and 2 500 flanges shall be provided with a counterbore as indicated in Tables 10 to 14 and the thread shall be chamfered to an angle between 30° and 50° at the bottom of the counterbore. The chamfer shall be concentric with the thread and shall have a major diameter equal to that of the counterbore.

5.6.4 Bolt holes

Bolt holes shall be equally spaced on the pitch circle diameter. In the case of type 21 flanges they shall be positioned such that they are symmetrical to the principal axes and such that no holes fall on these axes i.e. positioned "off-centre", see Figures 5 to 12.

5.7 Flange facings

5.7.1 Types of facings

The types of flange facings and flange face designations shall be as given in Figure 2. Dimensions of facings shall be as given in Figures 4, 5, 6, and 7 and Tables 5 and 6.

For facings types B, D and F the transition from the edge of the raised face to the flange face shall be by:

- a) radius; or
- b) chamfer.

5.7.2 Lapped type joints

Facings for lapped type joints (Figure 6) shall be one of the following types:

B, C, D, E, F and J.

The facings shall be in accordance with 5.7.1. The dimension t , indicated in Figure 6 shall be not less than the minimum thickness of the barrel of the stub-end, except that in the case of a spigot or tongue facing, the dimension t shall be not less than 6,4 mm.

5.7.3 Jointing face finish

5.7.3.1 All flange jointing faces shall be machine finished and shall have a surface finish in accordance with the values given in Tables 7 and 8 when compared with reference specimens by visual or tactile means.

NOTE It is not intended that instrument measurements be taken on the faces themselves: the R_a and R_z values as defined in EN ISO 4287 relate to the reference specimens.

5.7.3.2 For flanges with facing types A, B, E and F turning shall be carried out with a round-nosed tool in accordance with Table 7.

5.7.3.3 For tongue and groove and ring-joint facing types C, D and J the gasket contact surfaces shall be machined to produce a surface finish in accordance with Table 8.

5.8 Spot facing or back facing of flanges

Any spot facing or back facing shall not reduce the flange thickness to less than the thickness specified.

When spot facing is used, the diameter shall be large enough to accommodate the outside diameter of the equivalent normal series of washers in accordance with EN ISO 887 for the bolt size being fitted. The bearing surfaces for the bolting shall be parallel to the flange face within the limits given in Table 15.

When a flange is back faced a minimum fillet radius at the hub, R_2 (see Figure 14) in accordance with Table 23, shall be maintained.

5.9 Tolerances

Tolerances on dimensions of flanges shall be as specified in Table 15.

5.10 Marking

5.10.1 Other than integral flanges

All flanges, other than integral shall be marked as follows:

- a) Flange manufacturer's name or trademark, e.g. X;
- b) Number of this standard, i.e. EN 1759-1;
- c) Flange type number, e.g. 11;
- d) Nominal size (DN) or NPS, e.g. DN 150;
- e) Class designation, e.g. Class 150;
- f) Nominal size (DN) or NPS e.g. DN 150 or 6; Bore diameter B if necessary, e.g. 146 mm;
- g) Either material symbol or material number or material group (see Tables 3a and 3b), e.g. A 105;
- h) Cast number of melt identification or suitable quality control number traceable to the cast number, e.g. 12345;
- i) Flanges grooved for standard ring type joints shall be marked with the letter "R" and the corresponding ring number;

EXAMPLE xxx/EN 1759-1/11/DN150//Class 150/146/A105/12345.

For material repaired by welding see 5.2.

5.10.2 Stamping

Where steel stamps are used, the marking shall be positioned on the outer rim of the flange.

NOTE Care should be taken to ensure that steel stamp markings are not liable to cause cracks in the flange material.

5.10.3 Omission of markings

If a flange is too small to enable all the markings required then the minimum marking required shall be:

- Flange manufacturer's name or trademark;
- Letters "EN";
- Class designation;
- Either the symbol or the number or the grade of the material or the material group;
- Cast number or melt identification or suitable control number.

5.10.4 Declaration of compliance

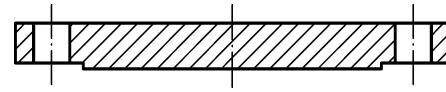

Marking EN 1759-1, together with the flange manufacturer's name or trademark on or in relation to a product represents a flange manufacturer's declaration of compliance, i.e. a claim by or on behalf of the manufacturer that the product meets the requirements of this standard.

Table 1 — Types of flange

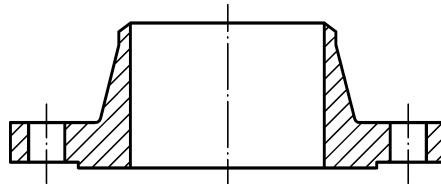

Type no. ^a	Description
01	Plate flange for welding
05	Blank flange
11	Weld-neck flange
12	Hubbed slip-on flange for welding
13	Hubbed threaded flange
14	Hubbed socket-weld flange
15	Loose hubbed flange for lapped pipe end ^b
21	Integral flange
NOTE Flanges and facings may be designated by type number and facing letter or by description as given in Figures 1 and 2 respectively.	
^a Type numbers have been made non-consecutive to permit possible future additions.	
^b Sometimes referred to in industry as lapped flange.	

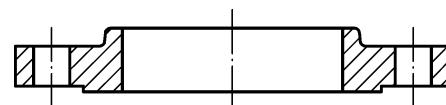

Type 01, Plate flange for welding

Type 05, Blank flange

Type 11, Weld-neck flange

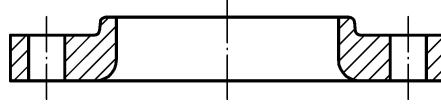

Type 12, Hubbed slip-on flange for welding

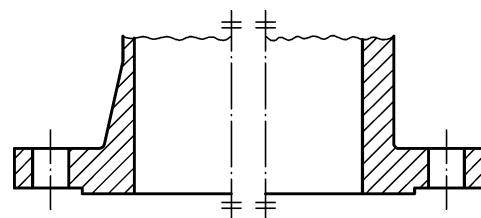

Type 13, Hubbed threaded flange

Type 14, Hubbed socket weld flange

Type 15, Loose hubbed flange for lapped pipe end

Type 21, Integral flange

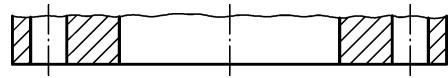

NOTE 1 Types 01 and 05 comprise flanges that do not incorporate hub or weld-neck.

NOTE 2 Types 11 to 15 comprise flanges incorporating a hub or weld-neck and are manufactured from forgings or castings.

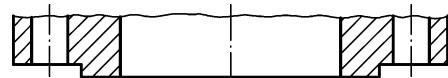

NOTE 3 Type 21 is an integral part of some other equipment or component.

NOTE 4 Flanges are designated by type numbers.

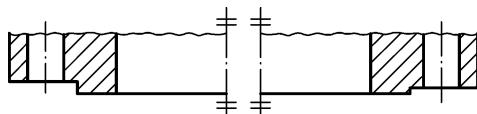

Figure 1 — Flange types

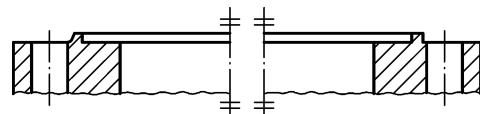

Type A, Flat face

Type E, Spigot

Type B, Raised face

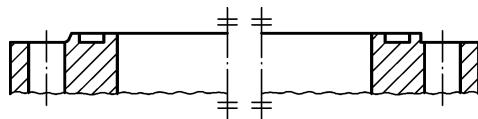

Type F, Recess

Type CL (Large tongue) and type CS (Small tongue)

Type J, Ring-joint

Type DL (Large groove) and type DS (small groove)

NOTE 1 When provided with a 6,4 mm raised face, type B is identical to type E

NOTE 2 Sketches designated A,B,C,D,E,F and J illustrate the various types of flanges which may be used in conjunction with the flanges shown in Figure 1.

NOTE 3 Facings are designated by type letters.

Figure 2 — Facing of types A to F and J

Table 2 — Synoptic table

**Hub type flange****Blank flange (threaded as Note)**

A hub is required if the nominal size of the reduced bore is equal to or greater than the size given in Table 4 for the nominal pipe size of the flange. Otherwise, a blank flange suitably tapped may be used.

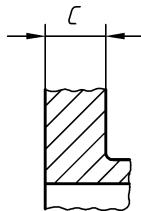

The nominal size appropriate to a flange of a given outside diameter and pressure Class may be found by reference to the Table of standard flanges of the same pressure Class (see Tables 9 to 14).

NOTE The threading and counterbore etc., should be in accordance with 5.6.3

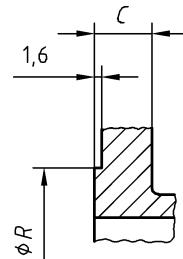

Figure 3 — Reducing threaded and slip-on flanges, all Classes (see Table 4)**Table 4 — Reducing threaded and slip-on flanges, all Classes**

Nominal pipe size appropriate to the diameter of the flange		Smallest nominal size of reduced bore requiring hub (see explanation in Figure 3)

Dimensions in millimetres

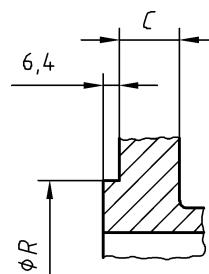

Type A (Flat face)

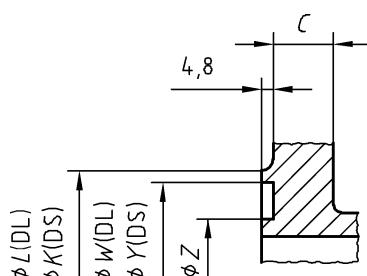

Type B 1,6 mm (Raised face)

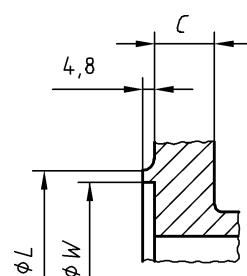

Type CL (Large tongue face) or type CS (Small tongue face)

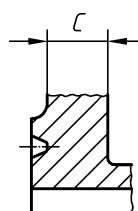

Type E (Spigot face (Large male))

Type DL (Large groove face) or type DS (Small groove face)

Type FC (Recess face (Large female))

Type J (Ring-joint face)

NOTE 1 For dimensions X, O, M, W, Z and other details for facings other than ring-joint, see Table 5.

NOTE 2 For other dimensions and details of ring-joint facings, see Table 6.

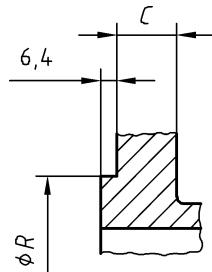

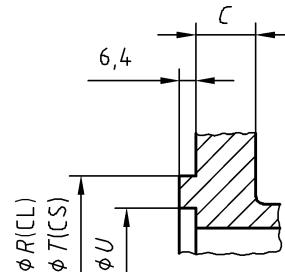

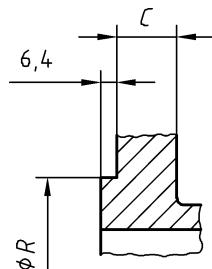

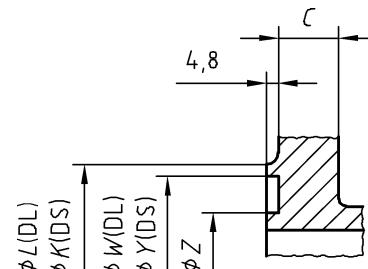

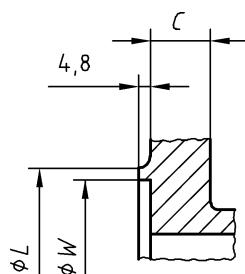

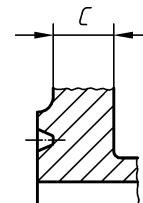

NOTE 3 C is the minimum flange thickness, see Tables 9 and 10.

NOTE 4 Dotted lines indicate full-face.

NOTE 5 Spigot/recess and tongue/groove faces are not applicable to Class 150 because of potential dimensional conflicts.

Figure 4 — Flange facings, Classes 150 and 300 only, for other than lapped-type joints

Dimensions in millimetres

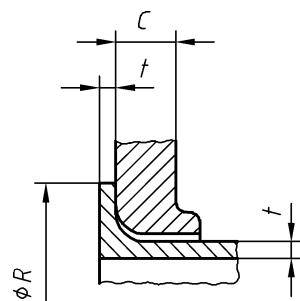

**Type B (6,4 mm Raised face)****Type CL (Large tongue face) or type CS (Small tongue face)****Type E (Spigot face (Large male))****Type DL (Large groove face) or type DS (Small groove face)****Type F (Recess face (Large female))****Type J (Ring-joint face)**NOTE 1 For dimensions X , O , M , W , Z and other details for facings other than ring-joint, see Table 5.

NOTE 2 For other dimensions and details of ring-joint facings, see Table 6.

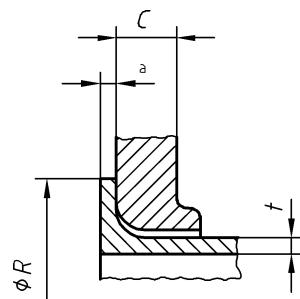

NOTE 3 C is the minimum flange thickness, see Tables 11, 12, 13 and 14.

NOTE 4 Dotted lines indicate full-face.

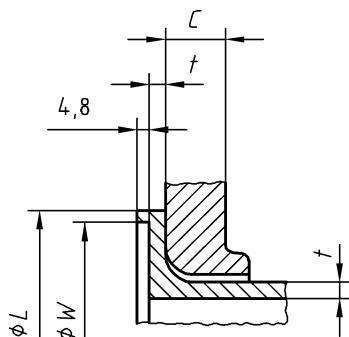

Figure 5 — Flange facings, Classes 600 to 2 500, for other than lapped-type joints

Type B (Raised face)

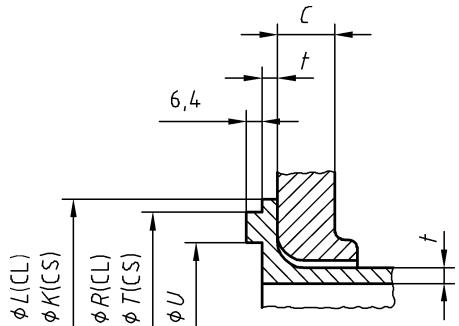

Type E (Spigot face (Large male))

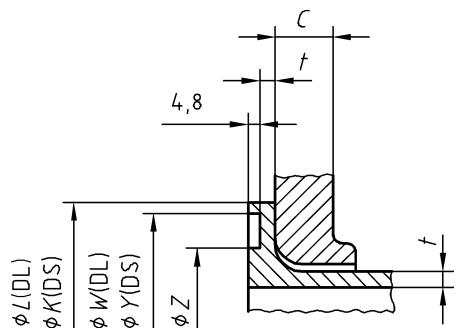

Type F (Recess face (Large female))

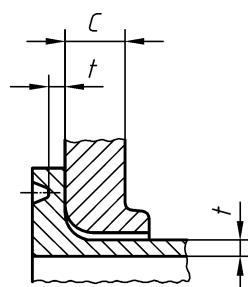

Dimensions in millimetres

Type CL (Large tongue face) or type CS (Small tongue face)

Type DL (Large groove face) or type DS (Small groove face)

Type J (Ring-joint face)

- NOTE 1 For dimensions X , O , M , W , Z and other details for facings other than ring-joint, see Table 5.
- NOTE 2 For other dimensions and details of ring-joint facings, see Table 6.
- NOTE 3 C is the minimum flange thickness, see Tables 9 to 14.
- NOTE 4 t = thickness of barrel of stub-end (see 5.7.2).

NOTE 1 For ring-joints with lapped flanges in Class 300 and 600, ring and groove number R 30 are used instead of R 31.

NOTE 2 For facing requirements for lapped joints, see Figure 6.

NOTE 3 Height of raised portion is equal to the depth of groove E but is not subject to the tolerance for E . The former full face contour may be used.NOTE 4 For sizes $1\frac{1}{2}$ in (DN 15) to $2\frac{1}{2}$ in (DN 65) Class 1 500 flanges are used instead of Class 900.

NOTE 5 Tolerances are given in Table 15.

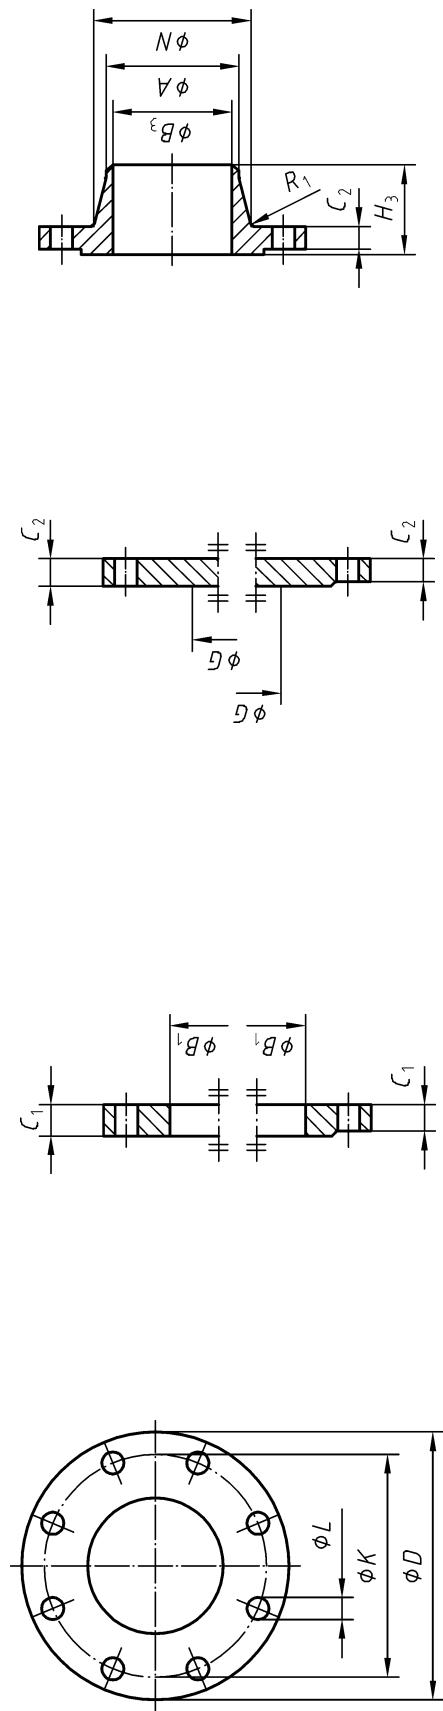

NOTE 6 Small deviations against ASME B16.5 are caused by conversion.

Table 7 — Surface finish for jointing faces (facing types A, B1, B2, E and F)

Flange rating	Method of machining	Approximate depth of serration mm	Approximate radius of tool nose mm	Approximate pitch of serration mm	R_z^a µm		R_a^a µm	
					min.	max.	min.	max.
Class 150 to Class 2 500	Turning ^b	0,05	1,6	0,8	12,5	50	3,2	12,5
Facing types B1 and B2: B1 is the standard finish, B2 is to be agreed in the order.								
NOTE For certain applications, e.g. for searching media such as low temperature gases and for flanges of Class 900 and above, it may be necessary to stipulate closer control on the surface finish.								
^a R_a and R_z are defined in EN ISO 4287.								
^b The term "turning" includes any method of machine operation producing either serrated concentric or serrated spiral grooves.								

Table 8 — Surface finish for jointing faces (facing types C, D and J)

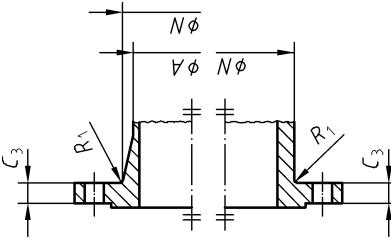

Facing	R_z µm		R_a µm	
	min.	max.	min.	max.
Type C and D Tongue and groove	3,2	12,5	0,8	3,2
Type J Ring-joint groove (including side walls)	1,6	6,3	0,4	1,6

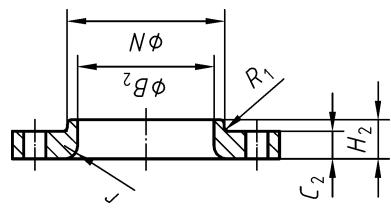

NOTE 1 This diagram illustrates the arrangement but not necessarily the correct number of bolt holes

Arrangement of bolt holes

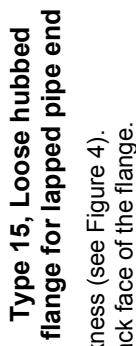

Type 11, Weld-neck flange

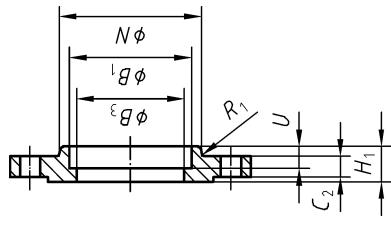

Type 05, Blank flange

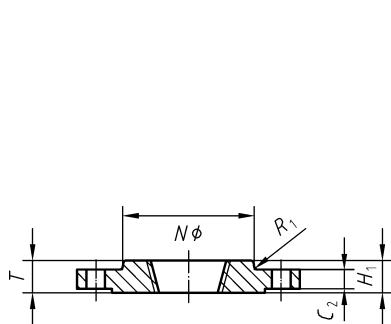

Type 21, Integral flange

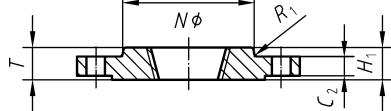

Type 15, Loose hubbed flange for lapped pipe end

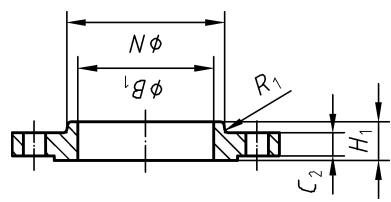

Type 14, Hubbed socket weld flange

Type 13, Hubbed threaded flange for welding

Type 12, Hubbed slip-on flange for welding

NOTE 2 The C_1 and C_2 dimensions include the 1,6 mm raised face but other facings will increase the thickness (see Figure 4).
 NOTE 3 Dimensions N is measured at the intersection of the projections of the hub draft angle and the back face of the flange.
 NOTE 4 Alternative forms are indicated by the use of dotted lines.
 NOTE 5 For dimensions G refer to note 2 of 5.6.1.

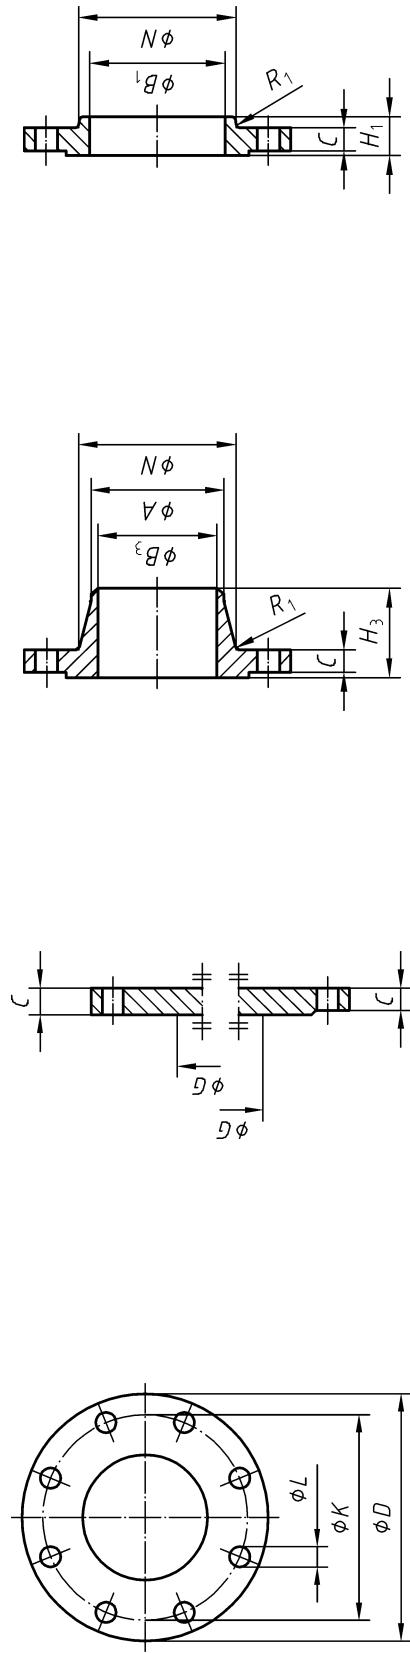

Figure 8 — Dimensions of Class 150 flanges (see Table 9)

a The use of these sizes should be avoided in new constructions.

NOTE 1 This diagram illustrates the arrangement but not necessarily the correct number of bolt holes

Type 13, Hubbed threaded flange

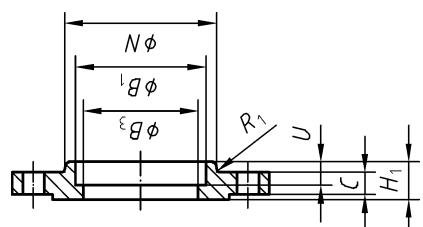

Type 05, Blank flange **Type 11, Weld-neck flange** **Type 12, Hubbed slip-on flange for welding**

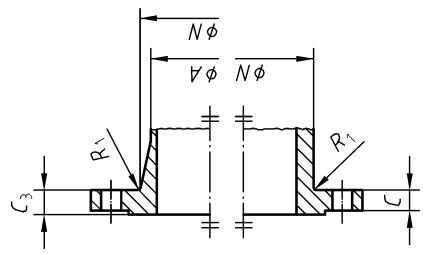

Type 13, Hubbed threaded flange

Type 21, Integral flange

Type 15, Loose hubbed flange for lapped pipe end

Type 14, Hubbed socket weld flange **Type 15, Loose hubbed flange for lapped pipe end**

Type 21, Integral flange

NOTE 2 Dimension N is measured at the intersection of the projections of the hub draft angle and the back face of the flange.
NOTE 3 Alternative forms are indicated by the use of dotted lines.
NOTE 4 For dimension G refer to note 2 of 5.6.1

See the notes to this Table on page 43.

^a The use of these sizes should be avoided in new constructions.

Notes to Tables 9 to 14

NOTE 1 For tolerances see Table 15.

NOTE 2 For facings see 5.7, Figures 4 to 7.

NOTE 3 For facing dimensions see Tables 5 and 6.

NOTE 4 For spot facing or back facing see 5.8.

NOTE 5 For threads in threaded flanges see 5.6.3.

NOTE 6 Neck diameter N , is the theoretical maximum which will permit the use of ring spanners or the fitting, if required, of the normal series of washers without some form of additional machining such as spot facing (see 5.8).

NOTE 7 The bore sizes of type 21 flanges are usually equal to the nominal size of the pipe, valve or fitting to which they form a part and the actual bore sizes are usually given, in the appropriate standard(s) for the component.

NOTE 8 For reducing threaded and slip-on flanges see Figure 3 and Table 4.

NOTE 9 When Class 150 and class 300 flanges are required with flat face, either the full thickness C or thickness with the raised face removed may be supplied. Users are reminded that removing the raised face will mean that the thickness and length through the hub could no longer be in accordance with this standard.

Table 15 — Tolerances

Dimension	Flange types	Tolerance mm	Size in
Hub diameter at weld end <i>A</i>	11, 21	+ 2,4 - 0,8	≤ 5
		+ 4,0 - 0,8	> 5
Bore diameter <i>B</i> ₁ , <i>B</i> ₂	01, 12, 14, 15	+ 0,8 - 0	≤ 10
		+ 1,6 - 0	> 10
Bore diameter <i>B</i> ₃	11, 14	± 0,8	≤ 10
		± 1,6	> 10 ≤ 18
		+ 3,2 - 1,6	> 18
Length through hub <i>H</i> ₁ , <i>H</i> ₂ , <i>H</i> ₃	11, 12, 13, 14, 15	± 1,6	≤ 10
		± 3,2	> 10
Flange thickness <i>C</i>	All	+ 3,2 0	≤ 18
		+ 4,8 0	> 18
Outside diameter of raised face <i>O</i>	All	1,6 mm raised face ± 0,8 mm	All sizes
		6,4 mm raised face ± 0,4 mm	
Facing dimensions <i>M</i> , <i>Q</i> , <i>W</i> , <i>Y</i> and <i>Z</i>	All	facing types C, D, E and F ± 0,4 mm	All sizes
Ring-joint depth <i>E</i>	All	facing type J + 4,8 - 0 ± 0,2 mm ± 0,13 mm ± ½°	All sizes
Ring-joint width <i>F</i>			
Ring-joint pitch <i>P</i>			
23° angle			
Diameter of bolt circle <i>K</i>	All	± 1,6 mm	All sizes
Centre-to-centre of adjacent bolt holes	All	± 0,8 mm	All sizes
Eccentricity of bolt circle and machined facing diameters	All	0,8 mm 1,6 mm	≤ 2½ > 2½
		1°	All sizes
Parallelism between bolting bearing surfaces and flange jointing face	All

NOTE 1 For limitations of temperature for individual materials see notes to Table 3a.

NOTE 2 Pressures and temperatures shown in bold type are conversions from ratings given in ANSI B16.5 — 1981: intermediate values shown in lighter type have been obtained by linear interpolation. For other intermediate values, it is recommended that they are obtained by linear interpolation using the original ANSI B16.5 figures shown in bold type.

NOTE 3 Temperature conversions from degrees Fahrenheit to degrees Celsius have been rounded to the nearest whole degree; pressure conversions from lbf/in² to bar have used a conversion factor of 1 lbf/in² = 0,0689476 bar and have been rounded to the nearest 0,1 bar.

a 1 bar = 10^5 N/m² = 10^5 pa.

NOTE 1 For limitations of temperature for individual materials see notes to Table 3a.

NOTE 2 Pressures and temperatures shown in bold type are conversions from ratings given in ANSI B16.5 — 1981: intermediate values shown in lighter type have been obtained by linear interpolation. For other intermediate values, it is recommended that they are obtained by linear interpolation use in the original ANSI B16.5 figures shown in bold type.

NOTE 3 Temperature conversions from degrees Fahrenheit to degrees Celsius have been rounded to the nearest whole degree; pressure conversions from lbf/in² to bar have used a conversion factor of 1 lbf/in² = 0,0689476 bar and have been rounded to the nearest 0,1 bar.

a 1 bar = 10^5 N/m² = 10^6 pa.

NOTE 1 For limitations of temperature for individual materials see notes to Table 3a.

NOTE 2 Pressures and temperatures shown in bold type have been obtained by linear interpolation. For other intermediate values, it is recommended that they are obtained by linear interpolation use in the original ANSI B16.5 figures shown in bold type.

NOTE 3 Temperature conversions from degrees Fahrenheit to degrees Celsius have been rounded to the nearest whole degree; pressure conversions from lbf/in² to bar have used a conversion factor of 1 lbf/in² = 0,0689476 bar and have been rounded to the nearest 0,1 bar.

a 1 bar = 10^5 N/m² = 10^5 pa.

NOTE 1 For limitations of temperature for individual materials see notes to Table 3a.

NOTE 2 Pressures and temperatures shown in bold type are conversions from ratings given in ANSI B16.5 — 1981; intermediate values shown in lighter type have been obtained by linear interpolation. For other intermediate values, it is recommended that they are obtained by linear interpolation use in the original ANSI B16.5 figures shown in bold type.

NOTE 3 Temperature conversions from degrees Fahrenheit to degrees Celsius have been rounded to the nearest whole degree; pressure conversions from lbf/in² to bar have used a conversion factor of 1 lbf/in² = 0,0689476 bar and have been rounded to the nearest 0,1 bar.

a 1 bar = 10^5 N/m² = 10^5 pa.

NOTE 1 For limitations of temperature for individual materials see notes to Table 3a.

NOTE 2 Pressures and temperatures shown in bold type are conversions from ratings given in ANSI B16.5 — 1981; intermediate values shown in lighter type have been obtained by linear interpolation. For other intermediate values, it is recommended that they are obtained by linear interpolation use in the original ANSI B16.5 figures shown in bold type.

NOTE 3 Temperature conversions from degrees Fahrenheit to degrees Celsius have been rounded to the nearest whole degree; pressure conversions from 1 lbf/in² to bar have used a conversion factor of 1 lbf/in² = 0,0689476 bar and have been rounded to the nearest 0,1 bar.

a 1 bar = 10⁵ N/m² = 10⁵ pa.

NOTE For the evaluation of the ratings the cast materials are excluded. The stresses are normally lower than those of forging and plate. As the cast flange is an integrally part of a body, so only flange thickness and mating dimensions are "fixed". Using all "open" dimensions, the flange can be individually designed to fulfill the rating of the group.

a Interpolation for — Ferritic materials from 50 °C and next given value, for
— austenitic materials from 20 °C to next given value.

The lowest service temperature (below – 10 °C) for the materials are given in the material standards and/or application codes.

Table 23 — Minimum fillet radius at the hub after back facing

Flange size	R_2 min. mm
Up to and including DN 50	2
Over DN 50 and up to and including DN 200	3
Over DN 200	5

NOTE For dimensions of R_1 see Tables 9 to 14.

Figure 14 — Minimum fillet radius at the hub after back facing

Annex A (informative)

Recommendations for weld ends of weld-neck flanges

Recommendations for welding neck flange ends of wall thickness up to 22,2 mm and greater than 22,2 mm are given in Figures A.1 to A.4.

Additional types of welding ends are specified in EN ISO 9692-2 and example of designs in EN 1708-1 and may be used by agreement between the equipment manufacturer and the flange manufacturer.

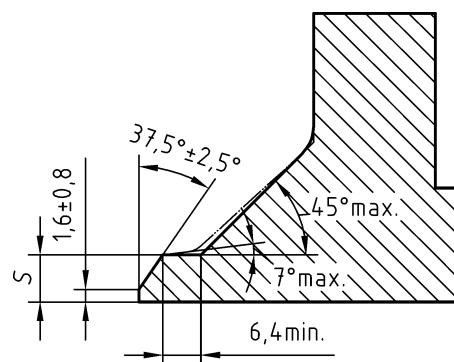

Figure A.1 — Bevel for wall thicknesses (s) up to 22,2 mm

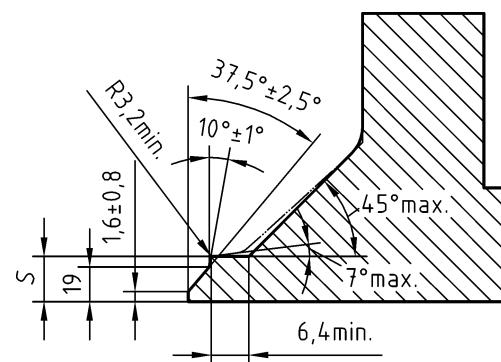

Figure A.2 — Bevel for wall thicknesses (s) greater than 22,2 mm

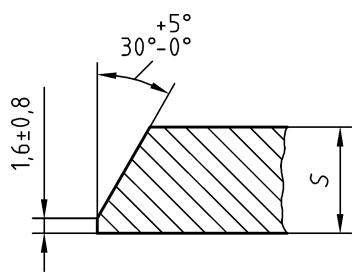

Figure A.3 — Alternative bevel for wall thicknesses (s) up to 22,2 mm

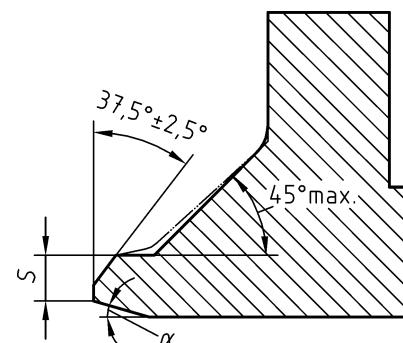

Figure A.4 — Acceptable bevel designs for unequal wall thicknesses

Linear dimensions are in millimetres.

NOTE 1 For flanges required to connect to ferritic steel pipe of nominal wall thickness less than 4,8 mm the welding ends should be finished to a slight chamfer or be square, at the option of the manufacturer.

NOTE 2 For flanges required to connect to austenitic stainless steel pipe of nominal wall thickness 3,2 mm or less, the welding ends should be finished to a slight chamfer.

NOTE 3 For dimensions of weld-neck flanges see Tables 9 to 14.

NOTE 4 s = nominal wall thickness.

Classification of bolting materials

Table B.1 — Classification of bolting materials^a

Bolting according to EN 1515-1			Diameter mm	Classification
Line	Material	Standard		
01	4.6	EN ISO 898-1	all	Low strength
02	5.6	EN ISO 898-1	all	Intermediate strength
04	8.8	EN ISO 898-1	all	High strength
05, 07	25CrMo4	EN 10269	all	High strength
06, 08	42CrMo4	EN 10269	all	High strength
09	30CrNiMo8	EN 10269	all	High strength
10	42CrMo5-6	EN 10269	all	High strength
11	40CrMoV4-6	EN 10269	all	High strength
12	21CrMoV5-7	EN 10269	all	High strength
13	20CrMoVTiB4-10	EN 10269	all	High strength
14	X6NiCrTiMoVB 25-15-2	EN 10269	all	Intermediate strength
15	X7CrNiMoNb16-16	EN 10269	all	High strength
16, 18	A4-50,A2-50	EN ISO 3506-1	< = 39	Low strength
17, 19	A4-70, A2-70	EN ISO 3506-1	< = 24	High strength
20	X5CrNiMo17-12-2 AT	EN 10269	all	Low strength
21	X5CrNiMo17-12-2 AT+C	EN 10269	all	Intermediate strength
22	X5CrNi18-10	EN 10269	all	Low strength
23	X5CrNi18-10 AT+C	EN 10269	all	Intermediate strength
NOTE 1	High strength bolting (allowable stress 170 N/mm ² and above) may be used in any flanged joint.			
NOTE 2 verified.	Intermediate strength bolting may be used in any flanged joint, provided the ability according to 5.3.1 is			
NOTE 3	Low strength bolting (yield stress 210 N/mm ² and below) is restricted to CL 150 and CL 300.			
^a Compliance with 5.3.1 shall be verified, with special consideration of the gasket.				

Annex C (informative)

Use of metric bolting in lieu of imperial bolting

C.1 General

Whilst not recommended, if users prefer or require to use metric bolting in lieu of the imperial bolting given in Tables 9 to 14, C.3 gives the comparable metric bolt sizes that have been agreed in the preparation of ISO 7005. The guidance notes on gasket assembly given in C.2 should be carefully observed (see Tables C.1 and C.2).

C.2 Gaskets

WARNING Users should note that the centring of an inside bolt circle gasket in an assembled flange joint will be affected when using metric bolting. In bolt sizes up to and including $1\frac{1}{2}$, the metric comparable sizes tend to be larger in diameter, whilst above this size they tend to be smaller. It is essential therefore that great care be taken to ensure that gaskets are centred properly.

However, dependant on the tolerances, which have been used it should be possible to fit the normal imperial dimensioned gasket when using metric bolting in existing imperial holes.

C.3 Comparable nominal bolt sizes

If metric bolting is to be used, the comparable imperial and metric nominal bolt sizes are as given in Table C.1.

Table C.1 — Nominal bolt sizes

Imperial	$\frac{1}{2}$	$\frac{5}{8}$	$\frac{3}{4}$	$\frac{7}{8}$	1	$1\frac{1}{8}$	$1\frac{1}{4}$	$1\frac{1}{2}$
Metric	M14	M16	M20	M24	M27	M30	M33	M39

To enable users to ascertain precisely the differences in the two systems, Table C.2 is given for reference.

Table C.2 — Imperial/metric bolt comparisons

Annex D

(informative)

Determination of p/T ratings for flanges using EN materials

Table D.1 — Allowable temperatures

Applicable to Groups 1E0 to 9E0	Applicable to Groups 10E0 to 16E0
Temperature – 29 °C to 375 °C The lowest of: — 60 % of the 0,2 % proof stress – $R_{p0,2}$ at RT — 60 % of the 0,2 % proof stress – $R_{p0,2}$ at T — 1,25 × allowable stress at temp. T (see below)	Temperature – 29 °C to 510 °C The lowest of: — 70 % of the 0,2 % proof stress – $R_{p0,2}$ at RT — 70 % of the 0,2 % proof stress – $R_{p0,2}$ at T — 1,25 × allowable stress at temp. T (see below)
Temperature > 375 °C The lowest of: — 60 % of the 0,2 % proof stress — $R_{p0,2}$ at T — 1,00 × allowable stress at temp. T (see below)	Temperature > 510 °C The lowest of: — 60 % of the 0,2 % proof stress — $R_{p0,2}$ at T — 1,00 × allowable stress at temp. T (see below)
allowable stress = the lowest of: $\frac{R_{m,RT}}{3}$ or $\frac{0,2\% \text{ Proof Stress}}{1,5}$ or $\frac{\text{Stress to Rupture in } 100\ 000 \text{ hrs.}}{1,5}$	allowable stress = the lowest of: $\frac{R_{m,RT}}{3}$ or $\frac{0,2\% \text{ Proof Stress}}{1,5}$ or $\frac{\text{Stress to Rupture in } 100\ 000 \text{ hrs.}}{1,5}$

D.1 Allowable pressure (bar)

- Class 2 500 Allowable Pressure =
$$\frac{\text{Selected Stress} \times 10 \times 2\ 500}{8\ 750}$$
- Class 1 500 Allowable Pressure = Class 2 500 Allowable Pressure $\times \frac{1\ 500}{2\ 500}$
- For Class 300, 600 & 900 Allowable Pressure, use 300 etc. instead of 1 500
- Class 150 Allowable Pressure, use ASME B16.5:1996 rules.

D.2 Maximum p/T ratings

The allowable pressure shall not exceed the ceiling pressure — temperature ratings shown in Table D1 of ASME B16.5:1996, they are imposed to limit deflections.

NOTE 1 D1 is in psig/°F units and needs conversion to bar/°C using linear interpolation.

NOTE 2 The rules of this annex are given for information only.

Annex E

(normative)

Approximate masses of flanges and collars

Tables E.1 to E.6 give calculated masses of raised face flanges, which may be used for guidance only.

These calculated masses are based on nominal dimensions given in Tables 9 to 14, and on densities of 7,85 g/cm³ for steel materials.

The actual masses may vary from the calculated masses due to dimensional variations within the permitted tolerances given in Table 15.

- EN 10269, *Steels and nickel alloys for fasteners with specified elevated and/or low temperature properties*
- EN 12560-1, *Flanges and their joints — Gaskets for Class-designated flanges — Part 1: Non-metallic flat gaskets with or without inserts*
- EN 12560-2, *Flanges and their joints — Gaskets for Class-designated flanges — Part 2: Spiral wound gaskets for use with steel flanges*
- EN 12560-3, *Flanges and their joints — Gaskets for Class-designated flanges — Part 3: Non-metallic PTFE envelope gaskets*
- EN 12560-4, *Flanges and their joints — Gaskets for Class designated flanges — Part 4: Corrugated, flat or grooved metallic and filled metallic gaskets for use with steel flanges*
- EN 12560-5, *Flanges and their joints — Gaskets for Class-designated flanges — Part 5: Metallic ring joint gaskets for use with steel flanges*
- EN 12560-6, *Flanges and their joints — Gaskets for Class- designated flanges — Part 6: Covered serrated metal gaskets for use with steel flanges*
- EN 12560-7, *Flanges and their joints — Gaskets for Class-designated flanges — Part 7: Covered metal jacketed gaskets for use with steel flanges*
- EN ISO 898-1, *Mechanical properties of fasteners made of carbon steel and alloy steel — Part 1: Bolts, screws and studs (ISO 898-1:1999)*
- EN ISO 3506-1, *Mechanical properties of corrosion-resistant stainless steel fasteners — Part 1: Bolts, screws and studs (ISO 3506-1:1997)*
- EN ISO 4287, *Geometrical product specifications (GPS) - Surface texture: Profile method - Terms, definitions and surface texture parameters (ISO 4287:1997)*
- EN ISO 9692-2, *Welding and allied processes — Joint preparation — Part 2: Submerged arc welding of steels (ISO 9692-2:1998)*
- EN ISO 15607, *Specification and qualification of welding procedures for metallic materials - General rules (ISO 15607:2003)*

BSI — British Standards Institution

BSI is the independent national body responsible for preparing British Standards. It presents the UK view on standards in Europe and at the international level. It is incorporated by Royal Charter.

Rewards

British Standards are updated by amendment or revision. Users of British Standards should make sure that they possess the latest amendments or editions.

It is the constant aim of BSI to improve the quality of our products and services. We would be grateful if anyone finding an inaccuracy or ambiguity while using this British Standard would inform the Secretary of the technical committee responsible, the identity of which can be found on the inside front cover.
Tel: +44 (0)20 8996 9000. Fax: +44 (0)20 8996 7400.

BSI offers members an individual updating service called PLUS which ensures that subscribers automatically receive the latest editions of standards.

Buying standards

Orders for all BSI, international and foreign standards publications should be addressed to Customer Services. Tel: +44 (0)20 8996 9001.
Fax: +44 (0)20 8996 7001. Email: orders@bsi-global.com. Standards are also available from the BSI website at <http://www.bsi-global.com>.

In response to orders for international standards, it is BSI policy to supply the BSI implementation of those that have been published as British Standards, unless otherwise requested.

Information on standards

BSI provides a wide range of information on national, European and international standards through its Library and its Technical Help to Exporters Service. Various BSI electronic information services are also available which give details on all its products and services. Contact the Information Centre.
Tel: +44 (0)20 8996 7111. Fax: +44 (0)20 8996 7048. Email: info@bsi-global.com.

Subscribing members of BSI are kept up to date with standards developments and receive substantial discounts on the purchase price of standards. For details of these and other benefits contact Membership Administration.
Tel: +44 (0)20 8996 7002. Fax: +44 (0)20 8996 7001.
Email: membership@bsi-global.com.

Information regarding online access to British Standards via British Standards Online can be found at <http://www.bsi-global.com/bsonline>.

Further information about BSI is available on the BSI website at <http://www.bsi-global.com>.

Copyright

Copyright subsists in all BSI publications. BSI also holds the copyright, in the UK, of the publications of the international standardization bodies. Except as permitted under the Copyright, Designs and Patents Act 1988 no extract may be reproduced, stored in a retrieval system or transmitted in any form or by any means – electronic, photocopying, recording or otherwise – without prior written permission from BSI.

This does not preclude the free use, in the course of implementing the standard, of necessary details such as symbols, and size, type or grade designations. If these details are to be used for any other purpose than implementation then the prior written permission of BSI must be obtained.

Details and advice can be obtained from the Copyright & Licensing Manager.
