BSI Standards Publication

Stainless steels

Part 1: List of stainless steels

bsi.

...making excellence a habit.™

National foreword

This British Standard is the UK implementation of EN 10088-1:2014. It supersedes BS EN 10088-1:2005 which is withdrawn.

The UK participation in its preparation was entrusted to Technical Committee ISE/105, Steels for Heat Treatment, Alloy Steels, Free-Cutting Steels and Stainless Steels.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Published by BSI Standards Limited 2014

English Version

Stainless steels - Part 1: List of stainless steels

Aciers inoxydables - Partie 1: Liste des aciers inoxydables

Nichtrostende Stähle - Teil 1: Verzeichnis der nichtrostenden Stähle

This European Standard was approved by CEN on 9 August 2014.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Foreword

This document (EN 10088-1:2014) has been prepared by Technical Committee ECISS/TC 105 “Steels for heat treatment, alloy steels, free-cutting and stainless steels”, the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by April 2015 and conflicting national standards shall be withdrawn at the latest by April 2015.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 10088-1:2005.

This document mainly differs from the 2005 edition as follows:

a) addition of austenitic grades 1.4615 (also part 3), 1.4618 (2), 1.4376 (2), 1.4640 (2), 1.4646 (2, 3), 1.4020 (3), 1.4378 (3), addition of austenitic-ferritic (duplex) grades 1.4162 (2, 3), 1.4662 (2, 3), 1.4658 (3), 1.4482 (2, 3), 1.4062 (2, 3), 1.4669 (3), addition of ferritic grades 1.4621 (2), 1.4600 (2), 1.4607 (2), 1.4611 (2, 3), 1.4613 (2, 3), 1.4630 (2), 1.4634 (2),addition of martensitic grade 1.4150 (3), addition of precipitation hardening grade 1.4612 (3);

b) chemical composition was changed for following grades:austenitic grade 1.4371, 1.4597, austenitic-ferritic grade 1.4362.

Each of the tables for the chemical composition of steel grades now has a sub-section with grades designated as 'uncommon' (i.e. not produced in the past 10 years and which may be removed during the next revision).

EN 10088, under the general title *Stainless steels*, consists of the following parts:

— *Part 1: List of stainless steels* (including a table of European Standards, in which these stainless steels are further specified, see Annex B) [the present document];

— *Part 2: Technical delivery conditions for sheet/plate and strip of corrosion resisting steels for general purposes*;

— *Part 3: Technical delivery conditions for semi-finished products, bars, rods, wire, sections and bright products of corrosion resisting steels for general purposes*;

— *Part 4: Technical delivery conditions for sheet/plate and strip of corrosion resisting steels for construction purposes*;

— *Part 5: Technical delivery conditions for bars, rods, wire, sections and bright products of corrosion resisting steels for construction purposes*.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Introduction

The European Organization for Standardization (CEN) draws attention to the fact that it is claimed that compliance with this document may involve the use of patents applied to ten steel grades.

CEN takes no position concerning the evidence, validity and scope of these patent rights.

The holder of these patent rights has ensured CEN that they are willing to negotiate licences, under reasonable and non-discriminatory terms and conditions, with applicants throughout the world. In this respect, the statements of the holders of these patent rights are registered with CEN. Information may be obtained from:

1 Scope

This European Standard lists the chemical composition of stainless steels, which are subdivided in accordance with their main properties into corrosion resisting steels, heat resisting steels and creep resisting steels and specified in the European Standards given in Table 1.

Table 1 — Overview of material standards for stainless steels

Stainless steels

Reference data on some physical properties are given in Tables E.1 to E.8.

NOTE 1 A matrix that shows which steels are included in which standard is given in Annex B.

NOTE 2 Valve steels are specified in EN 10090.

NOTE 3 Steel castings are specified in various European Standards (see Bibliography).

NOTE 4 Tool steels are specified in EN ISO 4957.

NOTE 5 Welding consumables are specified in various European Standards (see Bibliography).

2 Normative references

The following referenced documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 10079:2007, *Definition of steel products*

3 Terms and definitions

For the purposes of this document, the terms and definitions for the product forms given in EN 10079:2007 and the following apply.

3.1
stainless steels
steels with at least 10,5 % of chromium and maximum 1,2 % of carbon

[SOURCE: EN 10020:2000, 3.2.2]

Note 1 to entry: Stainless steels are further subdivided in accordance with their main property into corrosion resisting steels, heat resisting steels and creep resisting steels.

Note 2 to entry: One type of steel in Table 7 and five types of steel in Table 9 contain less chromium than the minimum defined for stainless steels, but are included in the heat-resisting and creep-resisting steels standards respectively, because they form a part of these two families of steels.

4 Chemical composition

The chemical composition of stainless steels is given:

— in Table 2 for austenitic corrosion resisting steels;

— in Table 3 for austenitic-ferritic corrosion resisting steels;

— in Table 4 for ferritic corrosion resisting steels;

— in Table 5 for martensitic and precipitation hardening corrosion resisting steels;

— in Table 6 for austenitic and austenitic-ferritic heat resisting steels;

— in Table 7 for ferritic heat resisting steels;

— in Table 8 for austenitic creep resisting steels;

— in Table 9 for martensitic creep resisting steels.

NOTE 1 The steel grades marked in Tables 2 to 9 as uncommon grades will be rechecked during the next revision and it will be decided whether to delete these steel grades or not.

NOTE 2 The chemical composition of nickel and cobalt alloys listed in EN 10095, EN 10269 and EN 10302 is given in Tables F.1 and F.2.

Table 2 — Chemical composition (cast analysis) of austenitic corrosion resisting steels

Elements not quoted in this table shall not be intentionally added to the steel without the agreement of the purchaser except for finishing the cast. All appropriate precautions are to be taken to avoid the addition of such elements from scrap and other materials used in production which would impair mechanical properties and the suitability of the steel.

a Maximum values unless indicated otherwise.

b For bars, rods, wire, sections, bright products and the relevant semi-finished products, a maximum content of 0,030 % S applies. Particular ranges of sulfur content may provide improvement of particular properties. For machinability a controlled sulfur content of 0,015 % to 0,030 % is recommended and permitted. For weldability, a controlled sulfur content of 0,008 % to 0,030 % is recommended and permitted. For polishability, a controlled sulfur content of 0,015 % max. is recommended.

c For austenitic steel grades intended for cold heading and cold extruding, a Cu-content of max. 1,0 % is permitted.

d Where for special reasons, e. g. hot workability for the fabrication of seamless tubes where it is necessary to minimize the deltaferrite content, or with the aim of low magnetic permeability, the maximum Ni content may be increased by the following amounts:

- 0,50 % (m/m): 1.4571;
- 1,00 % (m/m): 1.4306, 1.4406, 1.4429, 1.4434, 1.4436, 1.4438, 1.4541, 1.4550;
- 1,50 % (m/m): 1.4404.

e Parts made of high sulfur free cutting austenitic steels may not comply with European Directive 94/27 regarding articles in contact with human skin.

f For pressure purposes a carbon limit of C ≤ 0,07 % is allowed.

*) Patented steel grade.

X5NiCrTiMoVB25–15–2	1.4606	0,08	1,00	1,00 to 2,00	0,025	0,015	13,0 to 16,0	1,00 to 1,50	24,0 to 27,0	-	B: 0,001 0 to 0,010 Al: 0,35 Ti: 1,90 to 2,30 V: 0,10 to 0,50

Elements not quoted in this table shall not be intentionally added to the steel without the agreement of the purchaser except for finishing the cast. All appropriate precautions are to be taken to avoid the addition of such elements from scrap and other materials used in production which would impair mechanical properties and the suitability of the steel.

a Maximum values unless indicated otherwise.

b For bars, rods, wire, sections, bright products and the relevant semi-finished products, a maximum content of 0,030 % S applies. Particular ranges of sulfur content may provide improvement of particular properties. For machinability a controlled sulfur content of 0,015 % to 0,030 % is recommended and permitted. For weldability, a controlled sulfur content of 0,008 % to 0,030 % is recommended and permitted. For polishability, a controlled sulfur content of 0,015 % max. is recommended.

c Tighter carbon ranges may be agreed at the time of enquiry and order.

d For better cold deformability, the upper limit may be increased to 8,3 %.

e For increased mechanical properties, nitrogen may be added up to 0,15 %.

NOTE The grades given in this table are comparable to those given in Table 1. However, to compare similar grades, it is necessary to check each element before making a substitution.

a See the sources in the Bibliography.

b US steel listed in ASTM A959 and in UNS; if the steel number is given in brackets then the steel has only a UNS number.

c European steel listed in EN 10088–1:2014 and in the “Stahl-Eisen-Liste”; if the steel number is given in brackets then the steel is only listed in the “Stahl-Eisen-Liste”.

d Japanese Industrial Standard.

e Chinese steel of ISC number listed in GB/T20878.

f I = identical steel to ISO steel grade; *N* = steel grade with closer match of composition, but not identical; W = wider match.

Annex B
(informative)

Matrix to show which steels are included in which European Standard

Table B.1 — Matrix to show which steels are included in which standards (current at June 2004)

Classification of stainless steel grades

C.1 General

Stainless steels are classified according to 3 principles:

- use properties, to produce material standards;
- microstructure, to produce tables in the standards;
- significant alloying elements, to sort grades in the tables.

They may be further classified according to availability into standard grades and special grades. Special grades are intended for a particular use and with limited availability. Some alloy steels within the stainless steel definition are classified according to their use function as tool or valve steels.

C.2 Classification by use properties

C.2.1 Corrosion resisting

A corrosion resisting steel is a steel with a good resistance to uniform or local attack from the environment. The protection is provided by a minimum content of 10,5 % Cr through a spontaneously formed chromium oxide film. The environment may be atmospheric at ambient temperature (indoor, rural, urban, industrial, marine) or a solution giving electrochemical conditions.

EN grades are given steel numbers (EN 10027-2) in the groups:

- 1.40xx for grades with < 2,5 % Ni, without Mo, without special additions;
- 1.41xx for grades with < 2,5 % Ni, with Mo, without special additions;
- 1.43xx for grades with ≥ 2,5 % Ni, without Mo, without special additions;
- 1.44xx for grades with ≥ 2,5 % Ni, with Mo, without special additions;
- 1.45xx and 1.46xx for grades with special additions, such as Ti, Nb or Cu.

C.2.2 Heat resisting

A heat resisting steel is a steel, mainly ferritic or austenitic, with a good resistance to oxidation and the effects of hot gases and combustion products at temperatures higher than 550 °C. In oxidizing atmospheres a protective oxide layer is formed by chromium, silicon and aluminium on the steel surface. This oxide also reduces the attack from sulfur. In a reducing atmosphere, where no oxide is formed, an increased nickel content will reduce carbon and nitrogen pickup, but increases the susceptibility to sulfur attack.

EN grades are given steel numbers in the groups:

- 1.47xx for grades with < 2,5 % Ni;
- 1.48xx for grades with ≥ 2,5 % Ni.

C.2.3 Creep resisting

A creep resisting steel is a steel, mainly martensitic and austenitic, with good resistance to deformation under mechanical long-time stressing at temperatures above 500 °C. Several austenitic grades are variants of grades in C.2.1 and C.2.2 with specified minimum carbon content.

EN grades are given steel numbers in the group 1.49xx.

C.3 Classification by microstructure

C.3.1 Ferritic

Ferrite (alpha-iron, α-Fe) has a body centred cubic (bcc) atomic packing. It is magnetic, and is brittle below a characteristic transition temperature. Delta-ferrite (δ) is a residual bcc structure from the solidification process and has similar characteristics.

Ferritic steels are annealed at temperatures 750 °C - 950 °C, to avoid the formation of austenite. Heat treatments at higher temperatures (typical example: heat affected zones in welds) may result in the formation of austenite, which transforms to martensite on cooling, and may also cause embrittlement due to grain coarsening. These effects are reduced by stabilization of the C and N contents with Ti, Nb or Zr.

As a rule, ferritic steels have a poor weldability due to their sensitivity to intergranular corrosion and embrittlement in the heat affected zone.

In the ASTM standards, the ferritic grades are classified in the 400 series.

C.3.2 Martensitic

Martensite is formed from austenite during heat treatment or by cold working. It has a high strength and is magnetic.

Above 900 °C to 1 000 °C these steels have an austenitic structure with high solubility for carbon. Upon cooling the austenite transforms to a supersaturated solution of carbon in a quadratic body centred α'-matrix, i.e. martensite, which is stable down to ambient temperature.

If the structure contains a high amount of ferrite the steels are called "*martensitic-ferritic"* or "*semi-ferritic"*. Steel grade examples are grades 1.4005 and 1.4006.

Traditional martensitic steels have high carbon contents in the range 0,08 % to 1 %. They are air hardening on cooling, but their mechanical strength may be increased by a quenching heat treatment. The type of cooling (in air, oil or water) is adapted for each grade. The ductility is improved by a tempering treatment before use. With carbon contents > 0,20 %, they are difficult to weld.

Martensitic steels are also made with a low carbon content (max. 0,06 %) and 3 % to 6 % Ni. These steels have a balanced composition that promotes stable austenite after hardening and tempering and are called "*martensitic-austenitic"* or "*nickel martensitic"*. These steels have a relatively good weldability. Examples are grades 1.4313 and 1.4418.

The low carbon type has been further developed to "*supermartensitic"* steels. Typical compositions are 11 % to 13 % Cr, 2 % to 6 % Ni, 0 to 3 % Mo and max. 0,030 % C and N. Their high strength is combined with good impact strength and good weldability. An example is 1.4415 (X2CrNiMoV13-5-2).

In the ASTM standards, the martensitic grades are classified in the 400 series.

C.3.3 Precipitation hardening

After solution annealing and quenching, the precipitation of intermetallic compounds, carbides, nitrides or copper phase from the martensitic structure gives an increased strength.

The specific heat treatment conditions shall be adjusted depending on the desired level of mechanical properties and the data provided by the manufacturers.

Examples are grades 1.4568, 1.4542 and 1.4594.

C.3.4 Austenitic

Austenite (gamma-iron, γ Fe) has a face centred cubic (fcc) atomic packing. It is not magnetic, and is ductile over a wide temperature range, from cryogenic to creep temperatures. It does not display brittle fracture. The tensile strength is high at low temperatures. By coldforming it may be workhardened to high strength levels.

Austenitic grades are solution annealed within the range 1 000 °C to 1 200 °C. Austenite does not harden from heat treatment. Austenite formers like Ni, C and N promote the austenitic structure, whereas ferrite formers like Cr, Mo and Si promote a ferritic structure. Conventional austenitic grades may contain traces of delta ferrite, for improved weldability. Alloying with interstitial elements, particularly N, will increase the strength.

The stability of the austenitic structure depends on the amount of alloying elements. Grades with alloy content on the low side may transform to martensite during plastic deformation and/or by cooling to low temperature. They are called "*metastable austenitic"*. Typical examples are grades 1.4310 and 1.4318.

Ferrite traces and high chromium and molybdenum contents may promote precipitation of sigma phase (σ) which is brittle. The critical temperature range for precipitation of this and other intermetallic phases is 600 °C to 900 °C.

Stable austenitic grades without any ferrite are called "*fully austenitic*" and may require special care in hot forming and welding. Typical examples are grades 1.4466 and 1.4539.

Grades with excellent corrosion resistance in aggressive environments due to high chromium, molybdenum and nitrogen contents may be called "*superaustenitic"*. Typical examples are grades 1.4547 and 1.4652

The metallic materials grouping system in CEN ISO/TR 15608 defines a separate austenitic steel group 8.2, with typical chromium contents over 19 %. This group contains all superaustenitic and most fully austenitic grades.

In the ASTM standards, the austenitic grades with manganese contents equal to or lower than 2 % are classified in the 300 series.

C.3.5 Austenitic-ferritic (Duplex)

These steels have a well-balanced two-phase structure, with ferrite content between 30 % and 50 %. Strength properties are higher than for austenitic steels hence high power is required for cold deformation. These steels have a good resistance to stress corrosion cracking.

Sigma phase, and other phases that may reduce toughness and corrosion resistance, can be formed rapidly in the range 600 °C to 900 °C, primarily from the ferrite. Hot forming is therefore be performed well above these temperatures and followed by rapid cooling. Welds should be cooled rapidly through this range.

The metallic materials grouping system in CEN ISO/TR 15608 defines a separate austenitic-ferritic steel group 10.2, with typical chromium contents over 24 %. This group will contain "*superduplex*" grades with high chromium, molybdenum and nitrogen contents. Typical examples are grades 1.4410, 1.4507 or 1.4501.

In the ASTM standards, the austenitic-ferritic grades are classified in the 300 series.

C.4 Classification by significant alloying elements

C.4.1 Chromium and Nickel

Chromium and Nickel are the main alloying elements in stainless steel, and give the basic sorting order in EN standards. "*Cr-steel"* is a traditional term for ferritic grades, whereas "*CrNi-steel"* may be used for austenitic grades.

C.4.2 Molybdenum

Molybdenum improves the corrosion resistance, especially against chloride induced pitting. It is detrimental in oxidizing acids, like nitric acid, and in oxidizing atmospheres at high temperature.

Austenitic grades with over 2 % Mo may be called "*CrNiMo-steel"*. They were earlier called "*acid resisting"*, due to their resistance in the acid sulphite pulping process.

C.4.3 Manganese

Manganese is added as a substitute for nickel as an austenite former and to increase the solubility of nitrogen. The metallic materials grouping system in CEN ISO/TR 15608 defines a separate austenitic steel group 8.3, with manganese contents 2 % to 9 %.

In the ASTM standards, the austenitic grades with manganese contents higher than 2 % are classified in the 200 series.

C.4.4 Low carbon

Chromium carbides may precipitate in the grain boundaries during slow cooling after heat treatment or welding, and cause intergranular attack in contact with corrosive environments. The critical temperature range is 600 °C to 800 °C. The modern method to avoid intergranular corrosion is to make steels with ≤ 0,030 % carbon, so called LC-steels (Low Carbon), in which case all of the carbon remains in solid solution and does not combine with chromium to form chromium-carbide precipitates. The traditional method is described in C.4.6.

C.4.5 Nitrogen

Nitrogen, being a strong austenite stabilizing element, is added as a substitute for nickel as an austenite former and to increase strength as well as the resistance to pitting corrosion.

C.4.6 Stabilization

Addition of titanium, niobium and/or zirconium prevents the precipitation of chromium carbides following heat treatment and/or welding processes. Stabilization was the preferred method up to the 1960s, when technological advances enabled low carbon grades to be made cheap and reliable. Stabilized grades display good strength properties up to about 600 °C.

C.4.7 Sulfur

Sulfur promotes chip breaking in machining operations and improves machinability considerably. Free cutting grades with 0,15 % to 0,35 % S are thus available with ferritic, martensitic and austenitic microstructure. The addition of sulfur is however detrimental to impact strength and corrosion resistance.

Annex D
(informative)

Empirical formulae for steel grade microstructure classification and pitting resistance ranking

The formulae given in Table D.1 are used for characterization of grades and classification into groups in cast condition (without PWHT). They may be updated and harmonized with other formulae in use. The traditional groups for Ferrite, Martensite and Austenite are complemented with transition groups marked in bold. The basis is the average chemical composition for the grade, i.e. (min+max/2). The steel groups are similar to the grouping of metallic materials in CEN ISO/TR 15608.

The FNA formula below is intended to be used for material in annealed condition. It's not intended to be used as an absolute Ferrite number determination method but can be used when minor chemical composition changes are of interest and how this might effect the microstructure. The formulae may also be used in steel manufacturing for statistical process control, and for optimization of properties within composition limits.

Table D.1 — Empirical formulae for steel grade microstructure classification

Microstructure characteristics	**Formulae and parameters**	**Range of application**	
FM Ferrite - Martensite-region in Schaeffler/de Long diagram	FM = (A - 1,2)/(F – 8) for *F* = min 8 where: *F* = 1,5Si + Cr + Mo + 2Ti + 0,5Nb A = 30C + 0,5Mn + 30N + Ni + 0,5Cu + 0,5Co	Fer	Ferritic when: FM = 0, 00 - 0,30
		Martensitic	**Ferritic-Martensitic** when: FM = 0,30 - 1,0
			Martensitic when: FM = 1,0 - 4
MS Ferrite - Martensite transform (1)	MS = 540 - 497C - 6,3Mn - 10,8Cr - 36,3Ni - 46,6Mo		Martensitic when: MS = 100 - 300
MNA Martensite Number based on Md30 (2)	MNA = 551 - 462(C+N) – 9,2Si – 8,1Mn – 13,7Cr – 29(Ni+Cu) - 18,5Mo - 68Nb		**Austenitic-Martensitic** when: MNA = 100 - 300
		Austenitic	**Metastable austenitic** when: MNA = 0 - 100 or MNK = (−2) - 0
MNK Martensite Number based on WRC-1992 diagram (4)	MNK = 25 – F – 0,90A for Mn = max 2,4 % MNK = 21 – 0,90F – A for Mn = 2,5 – 6,9 % MNK = 13 – 0,42F – 1,3A for Mn = min 7,0 % where: *F* = Cr + Mo + 2Ti + 0,7Nb A = 35C + 20N + Ni + 0,25Cu		
MS Austenite - Martensite transform (3)	MS = 502 – 810C - 13Mn - 1230N - 12Cr - 30Ni – 46Mo - 54Cu		Austenitic when: MS = (−1000) - (−10)

Microstructure characteristics	**Formulae and parameters**	**Range of application**	
SM Solidification Mode based on WRC-1992 diagram (4)	SM = F – 1,3A – 2,0 where: *F* = Cr + Mo + 2Ti + 0,7Nb A = 35C + 20N + Ni + 0,25Cu		Fully austenitic when: SM = (−30) - (−4)
FNA Ferrite Number based on complemented Schaeffler/de Long diagram (5)	FNA = 3,34F – 2,46A – 28,6 for FNA = max 5,9 FNA = 4,44F – 3,39A – 38,4 for FNA = 6,0 – 11,9 FNA = 4,06F – 3,23A – 32,2 for FNA = min 12 where: *F* = 1,5Si + Cr + Mo + 2Ti + 0,5Nb A = 30C + 0,5Mn + 30N + Ni + 0,5Cu + 0,5Co		Austenitic when: FNA = (−40) - 20
		Duplex	**Austenitic-Ferritic (Duplex)** when: FNA = 25 – 75 or SM = 8 - 15
IMP Intermetallic phases based on FNA equivalents and (3)	IMP = F - 0,23A - 20,2 for A = min 8,7 IMP = F + 1,25A - 32,8 for A = max 8,6	Sensitive to formation of IMP when: IMP = 4 - 10	
PRE Pitting Resistance Equivalent (6)	PRE = Cr + 3,3Mo + 16N most common formula for Supeaustenitic/duplex/ferritic PRE = Cr + 3,3Mo + 30N also for austenitic steels with Mo > 3%	Resistant when: PRE = 40 - 60

Annex F
(informative)

Chemical composition of nickel and cobalt alloys listed in EN 10095, EN 10269 and EN 10302

The chemical composition of nickel and cobalt alloys listed in EN 10095, EN 10269 and EN 10302 are given in Tables F.1 and F.2.

Table F.1 — Chemical composition (cast analysis) of nickel alloys listed in EN 10095

Alloy designation		% by mass [a]															
Name	Number	C	Si	Mn	P	S	Cr	Mo	Ni	Fe	Co	Al	Cu	Ti	Nb+Ta	B	Ce
NiCr15Fe	2.4816	0,05 to 0,10	0,50	1,00	0,020	0,015	14,0 to 17,0	-	≥ 72,0	6,0 to 10,0	[b]	0,30	0,50	0,30	-	-	-
NiCr20Ti	2.4951	0,08 to 0,15	1,00	1,00	0,020	0,015	18,0 to 21,0	-	Remainder	5,0	5,0	0,30	0,50	0,20 to 0,60	-	-	-
NiCr22Mo9Nb	2.4856	0,03 to 0,10	0,50	0,50	0,020	0,015	20,0 to 23,0	8,0 to 10,0	≥ 58,0	5,0	1,00	0,40	0,50	0,40	3,15 to 4,15	-	-
NiCr23Fe	2.4851	0,03 to 0,10	0,50	1,00	0,020	0,015	21,0 to 25,0	-	58,0 to 63,0	18,0	[b]	1,00 to 1,70	0,50	0,50	-	0,006	-
NiCr28FeSiCe	2.4889	0,05 to 0,12	2,50 to 3,0	1,00	0,020	0,010	26,0 to 29,0	-	≥ 45,0	21,0 to 25,0	[b]	-	0,30	-	-	-	0,03 to 0,09

Elements not quoted in the table may not be intentionally added to the alloy without the agreement of the purchaser except for finishing the cast. All appropriate precautions are to be taken to avoid addition of such elements from scrap and other materials used in production which would impair mechanical properties and the suitability of the alloy.

a Maximum values unless indicated otherwise.

b A maximum of 1,5 % Co is allowed and counted as nickel. Reporting of cobalt is not required.

Table F.2 — Chemical composition (cast analysis) of nickel and cobalt alloys listed in EN 10269 and/or EN 10302

British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards -based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at bsigroup.com/standards or contacting our Customer Services team or Knowledge Centre.

Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at bsigroup.com/shop, where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to bsigroup.com/subscriptions.

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

PLUS is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit bsigroup.com/shop.

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email bsmusales@bsigroup.com.

BSI Group Headquarters

389 Chiswick High Road London W4 4AL UK

Revisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.
