BSI Standards Publication

## Roll containers

Part 4: Performance requirements

**bsi.**

...making excellence a habit.™

**National foreword**

This British Standard is the UK implementation of EN 12674-4:2015. It supersedes BS EN 12674-4:2006 which is withdrawn.

The UK participation in its preparation was entrusted to Technical Committee PKW/0, Packaging.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

**Roll containers - Part 4: Performance requirements**

Conteneurs à roulettes - Partie 4: Exigences de performances

Rollbehälter - Teil 4: Leistungsanforderungen

This European Standard was approved by CEN on 5 March 2015.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

## Foreword

This document (EN 12674-4:2015) has been prepared by Technical Committee CEN/TC 261 "Packaging", the secretariat of which is held by AFNOR.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by October 2015, and conflicting national standards shall be withdrawn at the latest by October 2015.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 12674-4:2006.

The only technical change since the latest edition concerns the following point:

- modifications in the wording of the second paragraph in 5.2.

This European Standard is part of a series of four standards for roll containers and dollies. The other parts are entitled as follows:

- *Roll containers – Part 1 – Terminology*
- *Roll containers – Part 2 – General design and safety principles*
- *Roll containers – Part 3 – Test methods*

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

## **Introduction**

Roll containers and dollies are equipment intended for moving goods. They comprise apparatus fitted with fixed and/or swivel castors. For roll containers the superstructure comprises two or more frames which provide retention for items requiring transport and/or distribution.

Dollies and roll containers can be supplied in a variety of materials and additionally roll containers are supplied in four main styles. One of these styles, the Nesting style, is further sub-divided into five derived forms and the Demountable style is sub-divided into two derived forms. EN 12674-1 gives details of how these styles differ. EN 12674-2 gives methods of measuring working dimensions and aspects of design that manufacturers need to be aware of. Test methods are given in EN 12674-3 which are supported by performance levels in this Part 4, which take account of the normal static and dynamic loads applied in use.

This European Standard specifies minimum levels of performance for critical tests, in particular with reference to safety. Certain tests which are related only to longevity, quality control or need development are optional and if carried out may be subject to agreement between manufacturer and user. Tests are applied to fully assembled roll container and dolly specimens as indicated in Table 1. Dismantled or nested roll containers are not subjected to testing; however, empty dollies stacked ready for use, storage or transit need to be subjected to normative testing in order to determine a safe number of stacked units.

In order to calculate applied test loads a nominal safe working load (SWL) of 250 kg is assumed in this European Standard for every specimen. The value of 250 kg is not a normative level and may be reduced or increased by the testing body in collaboration with the specimen supplier/manufacturer. However, if different, the level used should be clearly stated in the test report.

## 1 Scope

This European Standard specifies appropriate tests and levels of performance for roll containers and dollies manufactured in all materials, assembled for use and stacked for storage when tested in accordance with EN 12674-3.

## 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 12674-1:1999, *Roll containers — Part 1: Terminology*

EN 12674-2:2001, *Roll containers — Part 2: General design and safety principles*

EN 12674-3:2004, *Roll containers — Part 3: Test methods*

## 3 Terms and definitions

For the purposes of this document, the terms and definitions given in EN 12674-1:1999 and the following apply.

### 3.1

#### **line of tilt $XX$**

axis in the horizontal plane about which an unstable roll container or dolly will eventually topple

Note 1 to entry: Shown as axis  $XX$  in EN 12674-3:2004, Figure 2.

### 3.2

#### **angle of tilt (alpha) $\alpha$**

angle measured against the major horizontal axis of the length or width of the roll container and the line of tilt

Note 1 to entry: Shown in EN 12674-3:2004, Figure 2.

Note 2 to entry: Length and width are defined in EN 12674-2:2001, 4.1.

### 3.3

#### **angle of inclination – (beta) $\beta$**

angle in a vertical plane, normal to the line of tilt, at which the roll container becomes unstable and topples sideways

Note 1 to entry: Shown in EN 12674-3:2004, Figure 1a and Figure 1b.

### 3.4

#### **geometric centre**

centre point in plan elevation generated by the intersection of two imaginary lines from the opposite internal corners of the base

### 3.5

#### **vertical axis**

central axis of a roll container or dolly passing through the geometric centre

**3.6**  
**ultimate load**

highest load sustained during a test by a specimen before collapse or failure

**3.7**  
**safe working load (SWL)**

maximum permissible load in kg to be carried by a particular design of roll container or dolly during its service life

## **4 Sampling of roll containers to be tested**

### **4.1 Sequence of tests**

All tests are independent of each other and may be carried out in any order. Results shall be listed in identical order to tests listed in this European Standard. A new untested or undamaged specimen or component shall be used in each test. All tests other than those referred to in 5.1.2 and 5.10.2 are prototype tests and may therefore result in destruction or damage to the specimen.

Unless otherwise stated by the roll container or dolly supplier/manufacture and in order to calculate applied test loads a nominal safe working load (SWL) of 250 kg is assumed for every specimen. The value of 250 kg SWL is not a normative level and may be reduced or increased by the testing body in collaboration with the specimen supplier/manufacture. However, if modified, the SWL level used shall be clearly stated in the test report.

### **4.2 Applicability of normative tests**

The following tests shall be applied to fully assembled roll container and dolly specimens where indicated in Table 1. Some tests are conducted on empty specimens and some with load as specified. Where specific performance requirements relating to individual tests apply, they are given in Clause 5.

Stacked dollies and dismantled stacked roll container bases intended for stacking shall be subjected to normative stability testing as detailed in 5.1.3.

Dismantled or nested roll containers are not subjected to normative testing.

Table 1 — Applicability of tests

Test in EN 12674-3		Dolly		Fully assembled roll container all types	
		Dummy load	Unloaded	Dummy load	Unloaded
4.2.1	Stability	✓✓✓✓	✓ <sup>a</sup>	✓✓✓✓	✓✓✓✓
4.2.2	Diagonal	-	✓✓ <sup>b</sup>	-	✓✓ <sup>b</sup>
4.2.3	Side	-	-	-	✓
4.2.4	Side to base	-	-	-	-
4.2.5	Castor	-	✓✓ <sup>c</sup>	-	✓✓ <sup>c</sup>
4.2.6	Floor UDL	-	-	-	-
4.2.7	Impact	-	-	-	-

4.3.2	Infill/infill	-	-	-	-
4.3.3	Frame infill	-	-	-	-
4.3.4	Strap	-	-	-	-
<p>✓ = this represents one test</p> <p>Only where tests are marked ✓ shall specimens be subjected to this test, where marked ✓✓ subjected to two tests e.g. one side, one end, etc.</p> <p><sup>a</sup> Test when dollies are stacked empty.</p> <p><sup>b</sup> Each diagonal to be tested separately using the same specimen.</p> <p><sup>c</sup> One test at each end, 2 tests in total.</p> <p><sup>d</sup> Two tests, one side and one end test.</p> <p><sup>e</sup> Neither A-frame nor V-frame shall be subjected to this test.</p>					

### Optional tests

Tests in EN 12674-3:2004, 4.3 are optional.

Tests in EN 12674-3:2004, Annex A are optional.

## 5 Performance requirements – normative tests

### 5.1 Stability tests (4.2.1 of EN 12674-3:2004)

#### 5.1.1 General

NOTE 1 Where this European Standard test protocol differs from EN 12674-3:2004 then this European Standard will take precedence.

NOTE 2 No recommendation is made for stability performance for the roll container known as a dairy cage.

NOTE 3 The standard dummy load in normative test 4.2.1 of EN 12674-3:2004 does not vary with roll container or dolly type, size or SWL since direct comparisons between designs would then be impossible. Additional tests may be specified by a manufacturer or user, but if specified are not part of this European Standard.

#### 5.1.2 Dolly - dummy load

With dummy load  $W$  equal to 50 kg, centrally placed at  $h = 250$  mm, the minimum angle of inclination  $\beta$  of the supporting table before instability or topple shall not be less than  $\beta = 28^\circ$  in any of four directions R, L, F or B.

#### 5.1.3 Dolly - stacked empty

With supporting test bed table set horizontal with  $\beta = 0^\circ$ , estimate the number of identical stacked units that will achieve stability. Place these in stacked position with the longest dolly dimension parallel to the test bed table hinge, setting castors on the supporting test bed table hinge-side in *toe-in* position. Incline the table slowly to  $\beta = 7^\circ$  and fix securely at this angle while holding stacked units secure, then add or subtract units until the stack just achieves stability. Record the number of stacked units.

NOTE If a manufacturer's moulded depressions in the dolly top deck forces an alternative castor position to *toe-in*, then these will take precedence and be used in the test.

#### 5.1.4 Roll container (unloaded)

Without load the minimum angle of inclination  $\beta$  before instability or topple shall not be less than  $\beta = 15^\circ$  in any of four directions R, L, F or B.

#### 5.1.5 Roll container (dummy load)

With dummy load  $W$  equal to 50 kg, centrally placed at  $h = 250$  mm, the minimum angle of inclination  $\beta$  before instability or topple shall not be less than  $\beta = 19^\circ$  in any of four directions R, L, F or B.

### 5.2 Diagonal resistance test (4.2.2 of EN 12674-3:2004)

For empty dollies and roll containers the test load as specified in EN 12674-3 shall be applied across the specimen diagonal  $d_1$  such that  $F$  equals  $0,6 \times \text{SWL}$ .

After release of load, residual distortion shall not be more than 0,3 % of the original specimen diagonal length  $d_1$ .

Repeat the test such that each of the two diagonals are tested for compliance with 0,3 % of original specimen diagonal.

### **5.3 Strength and stiffness of roll container sides (4.2.3 of EN 12674-3:2004)**

A roll container side may be removed or left in-situ for this test.

With test load positioning as specified in EN 12674-3, and test load  $W$  equal to  $0,1 \times SWL$  the maximum deflection under load  $d_1$  shall not exceed  $0,025 L$ .

Loading shall continue until inelastic distortion or fracture occurs and the result shall be recorded.

$L$  shall be the overall height of the side frame as defined by  $h_3$  in 4.4 of EN 12674-2:2001.

### **5.4 Side frame to base cantilever test (4.2.4 of EN 12674-3:2004)**

Roll container sides shall be left in-situ for this test. No recommendation is made for performance.

NOTE This is primarily a test for demountable sided roll containers.

### **5.5 Castor lateral load resistance test (4.2.5 of EN 12674-3:2004)**

With test load positioning as specified in EN 12674-3, free play in castors and wheels eliminated by means of a small preload and with test load  $F$  equal to  $0,75 \times SWL$  the specimen shall not distort/deflect more than 4 mm.

Residual distortion/deflection at zero load shall be less than 3 mm.

### **5.6 Distributed load floor test (4.2.6 of EN 12674-3:2004)**

No recommendation is made for performance.

### **5.7 Localised edge impact loading on floor test (4.2.7 of EN 12674-3:2004)**

No recommendation is made for performance.

### **5.8 Localised side/end base test (4.2.8 of EN 12674-3:2004)**

Apply to the specimen at B a full test load  $F$ , equal to  $0,8 \times SWL$  concentrated at hazard point A. At that full load the overall specimen dimension measured between points A and B shall be measured. For the dairy cage style of roll container, apply at B a reduced test load  $F$ , equal to  $0,4 \times SWL$  concentrated at hazard point A.

Upon release of load residual distortion measured up to 5 min after loading shall be not more than 8 mm.

### **5.9 Free fall drop test (4.2.9 of EN 12674-3:2004)**

#### **5.9.1 Method 1 (drop)**

No recommendation is made for performance.

NOTE This test would be relevant when loaded with the customers intended type of goods. A suitable protocol might be 3 cycles of drop, with inspection criteria assessed after unloading, when pass criteria would be zero damage to mounting points although pass criteria might allow castors to be destroyed.

#### **5.9.2 Method 2 (compression version)**

No recommendation is made for performance.

## **5.10 Starting and rolling resistance test (4.2.10 of EN 12674-3:2004)**

### **5.10.1 Tests 1 to 4 (specimen unloaded)**

No recommendation is made for performance.

### **5.10.2 Tests 1 to 4 (specimen loaded)**

The test load shall be equal to the users SWL on a test surface identical to the users working surface with 4 tests with castors initially set as follows:

- trailing castors at 0° to direction of motion;
- castors outwards at 90° and 270° to direction of motion;
- castors inwards at 270° and 90° to direction of motion;
- reversed castors at 180° to direction of motion.

NOTE 1 Resulting pushing force will take cognizance of local/national health and safety guidelines.

NOTE 2 These tests can only usefully be conducted on the user's premises in order to create correct test surface.

## **5.11 Stacking test (4.2.11 of EN 12674-3:2004)**

No recommendation is made for performance.

NOTE Because of the non standard and specific nature of proprietary couplings for stacked/superimposed units, it is appropriate that performance should be decided between manufacturer and user.

## **5.12 Mechanical lifting test (4.2.12 of EN 12674-3:2004)**

No recommendation is made for performance.

## **6 Performance requirements – optional tests**

### **6.1 Fatigue of welded joints - side frame to infill (4.3.1 of EN 12674-3:2004)**

No recommendation is made for performance.

### **6.2 Strength of welded joints - infill to infill (4.3.2 of EN 12674-3:2004)**

No recommendation is made for performance.

### **6.3 Strength and stiffness of frame infill (4.3.3 of EN 12674-3:2004)**

No recommendation is made for performance.

### **6.4 Tensile resistance of strap/buckle (4.3.4 of EN 12674-3:2004)**

No recommendation is made for performance.

# British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

## About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards-based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

## Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at [bsigroup.com/standards](http://bsigroup.com/standards) or contacting our Customer Services team or Knowledge Centre.

## Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at [bsigroup.com/shop](http://bsigroup.com/shop), where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

## Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to [bsigroup.com/subscriptions](http://bsigroup.com/subscriptions).

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

**PLUS** is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit [bsigroup.com/shop](http://bsigroup.com/shop).

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email [bsmusales@bsigroup.com](mailto:bsmusales@bsigroup.com).

## BSI Group Headquarters

389 Chiswick High Road London W4 4AL UK

## Revisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.

## Copyright

All the data, software and documentation set out in all British Standards and other BSI publications are the property of and copyrighted by BSI, or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use.
