# **BSI Standards Publication**

Multimedia systems and equipment — Multimedia e-publishing and e-books — Interchange format for e-dictionaries

BS EN 62605:2016 BRITISH STANDARD

#### **National foreword**

This British Standard is the UK implementation of EN 62605:2016. It is identical to IEC 62605:2016. It supersedes BS EN 62605:2011 which is withdrawn.

The UK participation in its preparation was entrusted to Technical Committee EPL/100, Audio, video and multimedia systems and equipment.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

# Multimedia systems and equipment - Multimedia e-publishing and e-books - Interchange format for e-dictionaries (IEC 62605:2016)

Systèmes et équipements multimedia - Publication et livres électroniques multimedia - Format d'échange pour les dictionnaires électroniques (IEC 62605:2016) Multimediageräte und -systeme - Multimedia e-publishing und e-books - Austauschformat für elektronische Wörterbücher (IEC 62605:2016)

This European Standard was approved by CENELEC on 2016-03-16. CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CENELEC member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

## **European foreword**

The text of document 100/2430/CDV, future edition 2 of IEC 62605, prepared by Technical Area 10 "Multimedia e-publishing and e-book technologies" of IEC/TC 100 "Audio, video and multimedia systems and equipment" was submitted to the IEC-CENELEC parallel vote and approved by CENELEC as EN 62605:2016.

The following dates are fixed:

•	latest date by which the document has to be implemented at national level by publication of an identical national standard or by endorsement	(dop)	2017-05-18
•	latest date by which the national standards conflicting with the	(dow)	2019-11-18

This document supersedes EN 62605:2011.

document have to be withdrawn

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CENELEC [and/or CEN] shall not be held responsible for identifying any or all such patent rights.

#### **Endorsement notice**

The text of the International Standard IEC 62605:2016 was approved by CENELEC as a European Standard without any modification.

In the official version, for Bibliography, the following notes have to be added for the standards indicated:

IEC 62448:2013 NOTE Harmonized as EN 62448:2014.

ISO 3166-1 NOTE Harmonized as EN ISO 3166-1.

# Annex ZA

(normative)

# Normative references to international publications with their corresponding European publications

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

NOTE 1 When an International Publication has been modified by common modifications, indicated by (mod), the relevant EN/HD applies.

NOTE 2 Up-to-date information on the latest versions of the European Standards listed in this annex is available here: www.cenelec.eu.

#### INTERNATIONAL ELECTROTECHNICAL COMMISSION

# MULTIMEDIA SYSTEMS AND EQUIPMENT – MULTIMEDIA E-PUBLISHING AND E-BOOKS – INTERCHANGE FORMAT FOR E-DICTIONARIES

#### **FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.

International Standard IEC 62605 has been prepared by technical area 10: Multimedia e-publishing and e-book technologies, of IEC technical committee 100: Audio, video and multimedia systems and equipment.

This second edition cancels and replaces the first edition published in 2011. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition.

- a) Ref element is added to facilitate cross reference between entries.
- b) A new version of LeXML format, which is one of the base formats of the first edition, has been expanded and becomes Annex B. (The existing format becomes Annex A.)

The text of this standard is based on the following documents:

CDV	Report on voting	
100/2430/CDV	100/2506/RVC	

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC website under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- · reconfirmed,
- withdrawn,
- · replaced by a revised edition, or
- · amended.

A bilingual version of this publication may be issued at a later date.

#### INTRODUCTION

Markets for multimedia e-books and e-publishing require standardization of formats for e-book data interchange among associated people, authors, data preparers, publishers and readers. The formats are classified into submission format, interchange format and reader's format. The submission format supports an interaction between authors and data preparers. The reader's format depends on e-publishing equipment. The interchange format provides an interchange format for data preparers and publishers and therefore should be e-publishing equipment independent.

The International Electrotechnical Commission (IEC) draws attention to the fact that it is claimed that compliance with this document may involve the use of patents.

IEC takes no position concerning the evidence, validity and scope of this patent right.

The holder of this patent right has assured the IEC that he/she is willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with IEC. Information may be obtained from:

Sharp Corporation, 22-22 Nagaike-cho, Abeno-ku, Osaka 545-8522, Japan

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those identified above. IEC shall not be held responsible for identifying any or all such patent rights.

ISO (www.iso.org/patents) and IEC (http://patents.iec.ch) maintain on-line data bases of patents relevant to their standards. Users are encouraged to consult the data bases for the most up to date information concerning patents.

## MULTIMEDIA SYSTEMS AND EQUIPMENT – MULTIMEDIA E-PUBLISHING AND E-BOOKS – INTERCHANGE FORMAT FOR E-DICTIONARIES

#### 1 Scope

This International Standard specifies the interchange format for e-dictionaries among publishers, content creators and manufacturers.

This International Standard does not address the following aspects:

- data formats for reading devices;
- elements necessary for final print reproduction only;
- rendering issues related to physical devices;
- · security issues such as DRM for documents.

#### 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC TS 62229:2006, Multimedia systems and equipment – Multimedia e-publishing and e-book – Conceptual model for multimedia e-publishing

#### 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

#### 3.1

#### manufacturer

organization or person that manufactures hardware and/or software of the e-book

#### 4 Position and requirements for interchange format for e-dictionaries

#### 4.1 Interchange format for e-dictionaries in contents creation/distribution model

The conceptual model for multimedia e-publishing (IEC TS 62229) defines a contents creation/distribution model shown in Figure 1.

#### Kev

- (1) content data in submission format
- (2) content data in interchange format
- (3) content data in reader's format

Figure 1 - Contents creation/distribution model

It should be noted that the role of manufacturers of e-dictionary hardware and software overlaps that of the publisher in Figure 1. Therefore, a slightly modified model will be assumed for this International Standard, as shown in Figure 2.

Figure 2 - Contents creation/distribution model (modified)

This International Standard specifies the interchange format between data preparers and publishers, i.e. a format for (2) in Figure 2, though it may be used as a reader's format.

#### 4.2 Requirements for interchange format for e-dictionaries

An interchange format for e-dictionaries needs to address the following.

- Description of keywords, links from the keywords to entries (link data) and the order of the entries.
- Description of articles for each entry (entry data). This includes text, image, and other multimedia functionalities generally required for e-books.
- Description of bibliographical data and other data. This should include the name of the author and the publisher, the title of the content and the explanatory note. The relationship between these concepts is visually represented in Figure 3.
- Description of contents written in various languages.

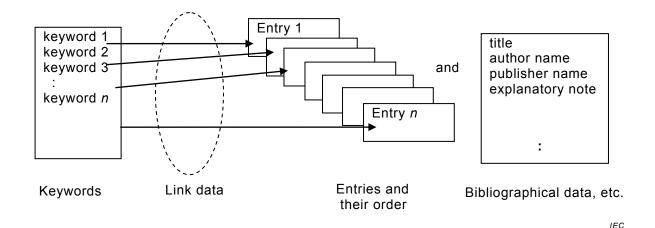

Figure 3 - Relationship between concepts

## 5 File formats

This International Standard defines two XML-based formats. One is based on XMDF (as described in IEC 62448:2013, Annex B) and LeXML. The format is hereafter called XMDF-LeXML format. The other is based solely on LeXML 3.0. They are presented in Annex A and Annex B, respectively.

NOTE LeXML is proposed by Digital ASSIST Ltd. Its original specifications are found at <a href="http://www.d-assist.com/index.html">http://www.d-assist.com/index.html</a> (in Japanese).

## 6 Semantics

Elements of the XMDF-LeXML format can be rendered in accordance with appropriate style specifications, which are outside the scope of this International Standard.

# Annex A (normative)

#### **XMDF-LeXML** format

#### A.1 General

The XMDF-LeXML format is an interchange format for e-dictionaries multimedia e-book data interchange, targeted at data preparers and publishers rather than the reader, with an emphasis on mobile devices as a target platform. Much like HTML, this format does not split the document in fixed pages, but determines the layout according to the viewer device's display size, the font in use, and so on. In this annex, such contents will be referred to as flowing content, as opposed to paged content.

#### A.2 Overview of the format's structure

Flowing contents are usually composed of several concatenated flows. This annex makes no particular requirement concerning the way the flowing content should be split into individual flows. This decision is left to the data preparer, to accommodate the various types of contents. For instance, a newspaper may have one flow per article, a novel one per chapter, and so on. It is also possible not to split the content, and to have only one flow. However, it should be noted that particularly large flows, or an extremely large number of flows, may impact on runtime performance, depending on the specific version of the viewer in use, the available memory, and so on.

The XML tree structure of the format is shown in Figure A.1.

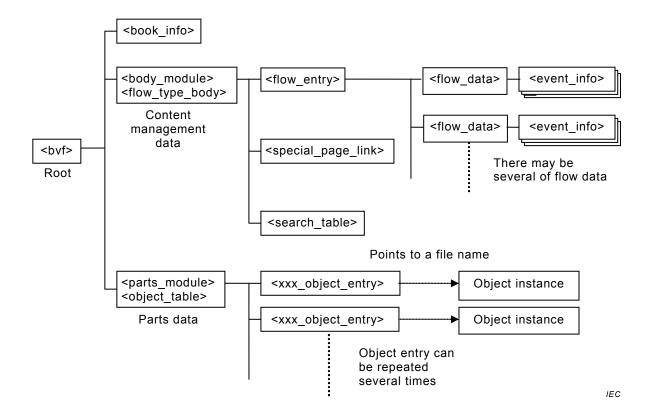

Figure A.1 – XML tree structure

The actual contents of each flow, in other words, what will be displayed by the viewer, is recorded in the object instance. The object instance is registered in object\_entry, and associated with an ID number and other auxiliary data, turning it into playable/displayable data. Flow\_data determines its content by pointing at such registered objects. In addition, information on functionalities such as page link is recorded in event\_info.

The main part of Annex A is generic, and may be used for any country and language. However, some parts may have language specific behavior. Localization-related issues are detailed in Clause A.6.

#### A.3 Elements and attributes

#### A.3.1 General

The different types of values that may be used in the various elements or attributes are explained below. The elements and attributes detailed below will be valid throughout this annex, and will be referenced by other constructs. In the following explanations, alphanumeric characters refer to numerals from 0 to 9 and alphabetic letters from a to z and A to Z.

#### A.3.2 Page\_ID

Page\_ID specifies a unique identification number for the flow data of the flowing contents. It is a string starting by the "PG" characters, followed by alphanumeric characters.

Example:

```
<flow_data flow_id="PG0002" ... />
```

#### A.3.3 Object\_ID

Object\_ID specifies a unique identification number for objects used in the flowing contents. It is a string starting by the "OB" characters, followed by alphanumeric characters.

Example:

```
<dynamic_text_object_entry id="OB0ue4".../>
```

#### A.3.4 Char\_ID

Char\_ID specifies an identification number for positions (character strings, etc.) within text and dictionary data objects. It is an alphanumeric string which is to be given uniquely in the text (see A.4.6.2) and dictionary data object instance (see A.4.6.3). Char IDs with the same value in different object instances are regarded as separate and don't affect each other.

Example:

```
<trigger_pointer id="OB29s0/CR0de4"/>
Click<char_id char_id="CR0001">here</char_id>for details.
```

#### A.3.5 Reading

For sorting purposes, reading may be useful to specify the reading of each word. Restricting the characters allowed for this purpose to a limited set makes it easier to define the sorting method. Such characters should be determined on a per language basis. All languages can

use the characters listed in Table A.1 as a common base, while the localization (see Clause A.6) will describe the language specific extensions to it.

Table A.1 - Base characters for reading

Name	Corresponding characters <sup>a</sup>	
Basic alphabet	et A to Z (U+0041 to U+005A)	
	A to z (U+0061 to U+007A)	
Numerals	0 to 9 (U+0030 to U+0039)	
Others	space (U+0020), ((U+0028), ) (U+0029)	
<sup>a</sup> [Attributes]II values are in Unicode.		

#### Example:

<title reading="PI">π</title>

#### A.3.6 Filename

Filenames should be written using the following convention. The path is relative to the file in which this reference is made. Network paths should not be used. For portability concerns, it is recommended that only ACSII characters be used. Both the slash and backslash characters are acceptable as directory separators. It is also recommended not to use excessively long filenames, as those might not be supported by the host operating system.

#### Example:

<dynamic\_text\_object\_entry src="sect1.xml" type="text/x-bvf-text" id="OB0ue4"/>

#### A.3.7 Standard character

The standard character set of the document, as set by the default\_ccs attribute of the <bvf>element (see A.4.2), is to be chosen from a well defined list, so as to ease the development of viewing software. However, this list may change for different localized versions of the XMDF-LeXML format. Any e-book data has to define its standard character set as one of or a combination of character set(s) listed in Table A.2 and those defined for a specific localization (see A.6.2).

Table A.2 - Standard character set

Character set name	Description
"ISO 646-IRV"	Characters in the range of US-ASCII

#### A.3.8 Standard character string

A string composed of Standard characters is called a Standard character string. Unless specified otherwise, the spacing characters (space (U+0020), linefeed (U+000D, U+000A, U+000D+U+000A), tabulation (U+0009)) are to be handled as follows:

Space (U+0020) to be displayed as is.

Linefeed (U+000D, U+000a, U+000D+U+000A) not to be displayed, but simply ignored.

Tabulation (U+0009) to be displayed as if it were a single space.

Furthermore, because of restriction in the XML format, linefeeds (U+000D, U+000A, U+000D+U+000A) and tabulations (U+0009) in attribute values should be replaced by spaces when converting to the distribution format.

#### A.3.9 Extended character

Characters which have Unicode code points while not being among those listed below are referred to as Extended characters.

Standard characters

Surrogate pair range (U+D800 to U+DFFF)

BOM (Byte Order Mark) (U+FFFE,U+FEFF)

NON CHARACTER (U+FFFF)

Control characters (characters between U+0000 and U+001F except tabulation (U+0009) and linefeed (U+000A, U+000D), as well as DEL (U+007F)).

If an e-book indeed uses any Extended character in its data, the name of a character set that covers those Extended characters should be appended to the default\_ccs attribute of the <bvf> element. Note that all Extended characters used in the document do not need to be covered by the same character set, as it is possible to specify several character sets.

#### A.3.10 Extended character string

A string composed of Standard characters and Extended characters is called an Extended character string. Unless specified otherwise, the spacing characters (space (U+0020), linefeed (U+000D, U+000A, U+000D+U+000A), tabulation (U+0009)) are to be handled the same way as in Standard character strings.

#### A.3.11 External character

To display a character which is neither a Standard character nor an Extended character, it is possible to use the <external\_char> element described below.

<external\_char> inserts an External character. The viewer may display it according to the following methods.

- a) Display the character set by the alt set and alt code attributes.
- b) Display the image set by the alt img or alt vimg attributes.
- c) Display the alternative letter set by the alt attribute.

Its syntax is given in Relax NG compact format below and explained in the following text.

NOTE For definitions that appear in the Relax NG compact representation of each element in this annex, see Clause A.8.

external\_char = element external\_char { attlist\_external\_char, text }

```
attlist_external_char &=
  attribute alt_set { text }?,
  attribute alt_code { text }?,
  attribute alt_img { text }?,
  attribute alt_vimg { text }?,
```

attribute img\_type { text }?,
attribute alt { text }?

#### [Attributes]

alt\_set:

Together with the alt\_code attribute, it allows designating the External character to be used. This alt\_set attribute indicates the font name, while the alt\_code attribute indicates the character code point within the font. The alt set attribute is written in the following way:

alt\_set = "font1,font2, ..."

The alt\_set attribute may hold several font names, separated by "," (U+002C). In that case, the viewer should use the first font of the list that is available (either from the platform, or included in the contents data itself) to display the character.

alt\_code:

Selects a character code point in the font specified by the alt\_set attribute. It may be written either as a decimal number or a hexadecimal number, prefixed by "0x". In case several fonts have been defined in the alt\_set attribute, the character code shall represent the same character in all of them. This attribute can be omitted.

alt\_img:

Defines an alternative character image. Written as a Filename. Before opening the file indicated by this attribute, the img\_type attribute should be checked for authorized file types. Note that it may be used only when <external\_char> is used in a text object instance. When both alt\_img and alt\_vimg are used, the file types shall match. This can be omitted. When this attribute is set, display should be done according to the following methods:

#### d) Monochrome images

Black pixels represent the letter, and white pixels the background. The font color and background color are to be displayed according to the color attribute of the <font> element.

e) Images with levels of gray

Black pixels represent the letter, and white pixels the background. The font color and background color are to be displayed according to the color attribute of the <font> element. The color of "gray" pixels shall be computed as an intermediate value between the font color and the background color.

f) Color images

Displayed as is.

alt\_vimg:

Defines an alternative character image to be used when the text is displayed vertically (as can be the case in some languages, such as Japanese). Written as a Filename. When omitted, the image defined in the alt\_img attribute should be used both for horizontal and vertical layout. Before opening the file indicated by this attribute, the img\_type attribute should be checked for authorized file types. Note that it may be used only when <external\_char> is used in a text object instance. When both alt\_img and alt\_vimg are used, the file types shall match. This can be omitted. When this attribute is set, the display should be done according to the same methods as with alt\_img.

img\_type:

Defines the mime type of the images files set in the alt\_img and alt\_vimg attributes. Currently, only PNG and JPEG are supported, and should be written as:

"image/png"

"image/jpeg"

When either alt\_img, alt\_vimg or both are set, this attribute is required. As with these two attributes, it can only be used in an <external\_char> element inside a text object instance.

alt:

Alternative character string. Written as a Standard character string. May be omitted.

Example:

#### A.3.12 External character string

An External character string is a string composed of Standard characters, External characters, or both. Unless specified otherwise, spacing characters (space (U+0020), linefeed (U+000D, U+000A), tabulation (U+0009)) should be handled the same way as they are handled in Standard character strings.

Example:

```
森<external_char alt_img="ou.png" alt_type="image/png" alt="鴎"/>外
内田百 <external_char alt_set="sharp_extchars" alt_code="0x2345" alt="間"/>
```

#### A.3.13 External extended character string

An External extended character string is a string of Standard characters, Extended characters, External characters, or a combination of any of the above. Unless specified otherwise, spacing characters (space (U+0020), linefeed (U+000D, U+000A), tabulation (U+0009)) should be handled the same way as they are handled in Standard character strings.

#### A.3.14 Coordinates

Data type to be used to store coordinates, dimension and other similar information composed of an x and a y value. It is written as (x, y). The name of the attribute which uses this type of data depends on the element.

The coordinate system explained below will be used in this annex. The origin is at the top left corner, the x axis oriented rightwards, and the y axis downwards. As the system of coordinates used by the viewer to map things on the screen is implementation-dependent, it will not be discussed here.

Local coordinate system:

The coordinate system local to an object takes its origin in the upper left corner of the circumscribed rectangle, and has the same orientation as the general coordinate system. Positions within an object should be expressed in the local coordinate system.

Example:

<vertex position="(100,200)"/>

IEC 62605:2016 © IEC 2016

#### A.3.15 Polygonal\_region

Data format to store the apexes of a polygon, or any other ordered sequence of vertexes. Each vertex is stored in a <vertex> element. When defining the shape of a polygon, the edges shall not cross. If they do, the viewer's behavior is unspecified. Its syntax is given in Relax NG compact format below and explained in the following text.

```
vertex = element vertex { attlist_vertex, empty }
attlist_vertex &= attribute position { text }
```

[Attribute]

position: the position of the apex, expressed as Coordinates. This attribute shall not

be omitted.

Example:

```
<vertex position="(100,0)"/> <!-- in the case of a triangle -->
<vertex position="(0,100)"/>
<vertex position="(200,100)"/>
```

#### A.3.16 Color

Data type to define colors. The following attributes are defined.

[Attributes]

color\_space: Specifies the color space to be used. Currently, only RGB is accepted. If

this attribute is omitted, the viewer should act as if RGB was set.

color: Specifies the color name. Color names or numerical values may be used.

Acceptable color names are listed in Table A.6. The default value depends on the actual element and context. Numerical values are to be written in the

following syntax.

In RGB: written as #RRGGBB. With RR, GG, BB being hexadecimal numbers, ranging from 00 to FF. Grayscale pixel values are represented by

setting RR, GG and BB to the same value.

opacity: level of opacity. Ranging from 0 (transparent) to 100 (opaque). Presently,

the only admitted value is 100, and in case the attribute is omitted, it

defaults to 100.

Example:

#### A.3.17 Date

Data format to store dates. It uses the same representation as ISO 8601. For instance, 1994-11-05T08:15:30-05:00 corresponds to November 5, 1994, 8:15:30 am, US Eastern Standard Time. Abbreviated forms are also accepted. Please refer to <a href="http://www.w3.org/TR/NOTE-datetime">http://www.w3.org/TR/NOTE-datetime</a> for details.

Example:

```
<publication_date type="publish">1994</publication_date>
```

#### A.3.18 Time

Data format to specify durations. Written as "XXdXXhXXmXXsXXXms", where X stands for a digit between 0 and 9. For instance, "10d5h30m10s015ms" would mean 10 days, 5 hours, 30 minutes, 10 seconds and 15 milliseconds. Abbreviated forms such as "5m30ms" or "1s" are possible. There is no upper bound to the number of days.

Example:

```
<flip_animation renewal_time="1s" >
```

#### A.3.19 Country

Data format to specify a country name. Written according to the ISO 3166-1 alpha 3 standard, in lower case.

Example:

```
<publication_place>jpn</publication_place>
```

#### A.3.20 Personal\_name

Data format to store people's names, such as the document author. It is stored under the <personal\_name> element. Its syntax is given in Relax NG compact format below and explained in the following text. Several child elements are used to define the various parts of the name: first name, middle name and last name. This information shall be entered via the elements defined below. At least one of <first\_name>, <middle\_name>, and <last\_name> shall be specified.

```
personal_name =
  element personal_name {
   attlist_personal_name,
   ((first_name?, middle_name?, last_name?)
   | (first_name?, last_name?, middle_name?)
   | (last_name?, first_name?, middle_name?)
```

```
| (last_name?, middle_name?, first_name?))
}
attlist_personal_name &= empty
```

#### [Child elements]

<first name>

Sets the first name. Written as an External character string. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

first\_name = element first\_name { attlist\_first\_name, TextWithGaiji }
attlist\_first\_name &= attribute reading { text }?

#### [Attribute]

reading:

Pronunciation of the first name, written as a Reading. May

be omitted.

<middle\_name>

Sets the middle name. Written as an External character string. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

middle\_name = element middle\_name { attlist\_middle\_name, TextWithGaiji } attlist\_middle\_name &= attribute reading { text }?

#### [Attribute]

reading:

Pronunciation of the middle name, written as a Reading. May be omitted.

<last name>

Sets the last name. Written as an External character string. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

last\_name = element last\_name { attlist\_last\_name, TextWithGaiji }
attlist\_last\_name &= attribute reading { text }?

#### [Attribute]

reading:

Pronunciation of the last name, written as a Reading. May be omitted.

#### Example:

```
<personal_name>
        <!-- to record John Smith -->
        <last_name>Smith</last_name>
        <first_name>John</first_name>
</personal_name>
```

#### A.3.21 Organization\_name

Data format to define company's name, such as publishers. It is stored in the <organization\_name> element. Written as an External character string. Its syntax is given in Relax NG compact format below and explained in the following text.

```
organization_name =
element organization_name { attlist_organization_name, TextWithGaiji }
attlist_organization_name &= attribute reading { text }?

[Attribute]
reading: Pronunciation of the company's name, written as a Reading. May be omitted.

Example:
```

<organization\_name >ABCD Corporation/organization\_name>

#### A.3.22 Address

Data format used to define an address, telephone number, email, and other information. Address-related information is all stored in child elements of a main <address\_info> element. Its syntax is given in Relax NG compact format below and explained in the following text.

```
address_info =
  element address_info {
   attlist_address_info,
   postal_code?,
   address?,
  telephone?,
  fax?,
```

```
mail address?,
  website?,
  address_other_info?
 }
attlist_address_info &= empty
[Child elements]
                    Stores the postal code (zip code) as a Standard character string. May be
   <postal code>
                    omitted. Its syntax is given in Relax NG compact format below.
   postal_code = element postal_code { attlist_postal_code, text }
   attlist_postal_code &= empty
   <address>
                    Stores the address as an External character string. May be omitted. Its
                   syntax is given in Relax NG compact format below.
   address = element address { attlist_address, TextWithGaiji }
   attlist address &= empty
   <telephone>
                    Stores the phone number as a Standard character string. May be omitted.
                    Its syntax is given in Relax NG compact format below.
   telephone = element telephone { attlist_telephone, text }
   attlist telephone &= empty
   <fax>
                    Stores the fax number as a Standard character string. May be omitted. Its
                   syntax is given in Relax NG compact format below.
   fax = element fax { attlist fax, text }
   attlist_fax &= empty
   <mail_address> Stores the mail address as a Standard character string. May be omitted.
                   Its syntax is given in Relax NG compact format below.
   mail_address = element mail_address { attlist_mail_address, text }
   attlist mail address &= empty
   <website>
                    Stores the home page's URI as a Standard character string. May be
                    omitted. Its syntax is given in Relax NG compact format below.
  website = element website { attlist_website, text }
```

```
attlist_website &= empty
```

<address\_other\_info> Allows storing additional information not covered by the preceding elements as an External character string. May be omitted. If this information is to be displayed, spaces (U+0020) and linefeeds (U+000D, U+000A, U+000D+U+000A) should be displayed as is, while tabulations (U+0009) should be displayed as spaces. Its syntax is given in Relax NG compact format below.

```
address_other_info =
  element address_other_info {
    attlist_address_other_info, TextWithGaiji
  }
attlist_address_other_info &=
  [ a:defaultValue = "preserve" ]
  attribute xml:space { "default" | "preserve" }?
```

#### Example:

#### A.3.23 Permission

Sets the permissions, such as the right to print, or copy. The various permissions are stored in child elements of the <permission\_info> element. When the <permission\_info> element is omitted, all permissions are set to the same value as when each permission element is omitted. The following explanations refer to an "authenticated user". Under usual circumstances, all viewers of the document are considered authenticated. However, the distribution format may include DRM technologies and authentication mechanisms. The syntax of the <permission\_info> element is given in Relax NG compact format below and explained in the following text.

```
permission_info =
  element permission_info {
    attlist_permission_info, print_permission?, copy_permission?
}
attlist_permission_info &= empty
```

#### [Child elements]

<print\_permission> Defines whether printing is permitted or not. When omitted, it is to be considered as if the permission attribute was set to "no". Its syntax is given in Relax NG compact format below and explained in the following text.

```
print_permission =
  element print_permission { attlist_print_permission, empty }
attlist_print_permission &=
  [ a:defaultValue = "no" ]
  attribute permission { "authorized" | "no" }?
```

#### [Attribute]

permission: Defines whether printing is permitted or not. The following

values are possible.

"authorized": authenticated users may print.
"no": no one can print (default value).

<copy\_permission> Define whether copying is permitted or not. When omitted, it is to be considered as if the permission attribute was set to no. Its syntax is given in Relax NG compact format below and explained in the following text.

```
copy_permission =
  element copy_permission { attlist_copy_permission, empty }
  attlist_copy_permission &=
  [ a:defaultValue = "no" ]
  attribute permission { "authorized" | "in_device_only" | "no" }?
```

#### [Attribute]

permission: Defines whether copying is permitted or not. The following

values are possible.

"authorized": authenticated users may copy.

"in\_device\_only": authenticated users may copy, but

only within the viewer device. If the device does not provide mechanisms to prevent external copy, then copy is

forbidden.

"no": No one can copy (default value).

#### Example:

#### A.3.24 Keyword

With the <keyword\_list> element, it is possible to attach a list of keywords to the bibliographical data, to a flow data, or to an object (in the present standard, it is limited to bibliographical data). A <keyword\_list> should contain one or more <keyword> elements as child element, each of these recording one keyword. The syntax of the <keyword> element is given in Relax NG compact format below and explained in the following text.

```
keyword = element keyword { attlist_keyword, TextWithGaiji }
attlist_keyword &=
attribute category { text }?,
attribute reading { text }?
```

#### [Attributes]

category: Defines the category the keyword belongs to, written as a Standard

character string. May be omitted.

reading: Records the pronunciation of the keyword, written as a Reading. May be

omitted.

#### [Child elements]

External character string: Records the actual keyword.

#### Example:

#### A.3.25 Telephone number

Data format to record telephone numbers. It allows dialing such a number when the viewer device is a telephone. It is written as a combination of the characters listed in Table A.3. The number of characters shall be between 1 and 64, inclusive.

If a function defined by the phone number cannot be executed, the viewer should not make the call. Namely,

when the phone number string is too long for the device to handle, when the phone number string includes characters not listed in Table A.3, when the phone number string contains a function which cannot be executed.

Table A.3 – Usable characters for a telephone number

Character	ASCII code	Meaning
0 to 9	0x30 to 0x39	number
#	0x23	# button
*	0x2A	* button
-	0x2D	Ignored.
	0x2C	Pause (one second).
,		If a one second pause cannot be made, wait for key press instead.
1	0x2F	Pause (wait for key press).
Porp	r p 0x50 or 0x70	Pause (wait for signal).
РОГР		If it is not possible to wait for the signal, wait for a key press instead.
+	0x2B	Sign to make an international call. Only at the beginning of a phone number.
T		(If entered in another position, do not make the call.)

## A.3.26 Mail\_address

Data format to store an email address. Written as local-part@domain. local-part and domain may use any of the characters recorded in Table A.4. The maximum length for local-part@domain is 256 bytes. Within the following characters, "&" (0x26) shall be written as an xml entity: "&". Such xml entities are counted as one byte.

Table A.4 - Characters usable for email addresses

Category	Characters	ASCII code
numerals	0 to 9	0x30 to 0x39
	A to Z	0x41 to 0x5A
alphabet	a to z	0x61 to 0x7A
!	!	0x21
\$	\$	0x24
%	%	0x25
&	&	0x26
*	*	0x2A
+	+	0x2B
-	-	0x2D
	-	0x2E
1	1	0x2F
=	=	0x3D
?	?	0x3F
۸	۸	0x5E
_	_	0x5F
~	~	0x7E

## A.4 Description format details

#### A.4.1 General

Each book takes the form of an xml document as can be seen below.

The character encoding used in the document is specified in the usual XML way, with the encoding attribute of the <xml> element. This annex recommends using UTF-8 or UTF-16 to avoid conversion problems, see A.6.8 for further details.

#### A.4.2 Book information modules <bvf>

#### A.4.2.1 General

The book information module is recorded in the <bvf> element. It serves as a root element for all data in the book, all information related to the document are stored inside it (it may also happen that only the filename of external files is stored here). The syntax of the <bvf> element is given in Relax NG compact format below and explained in the following text.

```
bvf = element bvf { attlist_bvf, book_info, body_module, parts_module }
attlist_bvf &=
attribute id_type { text }?,
attribute id { text }?,
attribute default_ccs { text },
attribute display_size { text }?
```

#### [Attributes]

id\_type: Defines what type of number is stored in the id attribute. Written as a

Standard character string. May be omitted.

id: Records the Identification number of this book, in the system specified by

the id type attribute. Written as a Standard character string. May be omitted.

Not to be confused with Reference ID (see A.4.6.3.4).

default ccs: Sets the name of the character set of the Standard characters (see A.3.7)

and Extended characters used in this annex (see A.3.9). When more than one character set is specified, they are separated by a "," (U+002C). Shall

not be omitted.

display\_size: Specifies the display (screen) size that was assumed while creating the

contents, written in the standard coordinates format. May be omitted.

```
[Child elements]
```

```
<book_info> Records bibliographical data. Shall not be omitted. See A.4.2.2 for details.
<body_module> Content management module. Shall not be omitted. See A.4.3 for details.
```

<parts\_module> Parts data modules. Shall not be omitted. See A.4.5 for details.

#### Example:

#### A.4.2.2 Bibliographical data <book\_info>

This is where bibliographical data, such as the author or the title, is stored. The syntax of the <book\_info> element is given in Relax NG compact format below and explained in the following text.

```
book_info =
element book_info {
  attlist_book_info,
  title_info,
  author_info?,
  publisher_info?,
  seller_info?,
  book_id_info?,
  classification_info?,
  rating?,
  publication_place?,
  publication_date_info?,
  net_price_info?,
  book_abstract?,
  front_cover_image?,
```

```
spine_cover_image?,
  keyword_list?,
  other_book_info?
 }
attlist_book_info &= empty
title_info =
 element title_info {
  attlist_title_info,
  series_title?,
  title,
  subtitle?,
  edition_info?,
  title_other_info?
 }
[Child elements]
  <title info>
                   Stores the information related to the title. Shall not be omitted. Its syntax is
                   given in Relax NG compact format below and explained in the following text.
  title_info =
   element title_info {
     attlist_title_info,
     series_title?,
     title.
     subtitle?,
     edition_info?,
     title_other_info?
  attlist_title_info &= empty
                  [Child elements]
```

The title of the series is recorded as an External character string in this element. If there is no series' title, it may be

<series\_title>

omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

series\_title = element series\_title { attlist\_series\_title, TextWithGaiji } attlist\_series\_title &= attribute reading { text }?

[Attribute]

reading: gives the pronunciation of the series' title

as a Reading. May be omitted.

<title> The title is recorded as an External character string in this

element. It shall not be omitted. Its syntax is given in Relax NG compact format below and explained in the

following text.

title = element title { attlist\_title, TextWithGaiji } attlist title &= attribute reading { text }?

[Attribute]

reading: gives the pronunciation of the title as a

Reading. May be omitted.

<subtitle> The subtitle is recorded as an External character string in

this element. If there is no subtitle, it may be omitted. Its syntax is given in Relax NG compact format below and

explained in the following text.

subtitle = element subtitle { attlist subtitle, TextWithGaiji } attlist subtitle &= attribute reading { text }?

[Attribute]

reading: gives the pronunciation of the subtitle as

a Reading. May be omitted.

<edition\_info> Information concerning the revision history of the book is recorded as an External character string in this element. May be omitted. If the information is to be displayed, the space character (U+0020), and the linefeed and carriage return characters (U+000D, U+000A, U+000D+U+000A) are to be displayed as is, but the tabulation character (U+0009) is to be displayed as if it were a space. Its syntax is given in Relax NG compact format below and explained in the following text.

```
edition_info =
 element edition_info { attlist_edition_info, TextWithGaiji }
attlist_edition_info &=
 attribute this version { text }?,
```

```
[ a:defaultValue = "preserve" ]
attribute xml:space { "default" | "preserve" }?
```

#### [Attribute]

this\_version:

Specifies which of the cited versions is the present one. For instance, "Third revision". May be omitted.

<title\_other\_info> Other information related to the title may be stored as an External character string in this element. May be omitted. If the information is to be displayed, the space character (U+0020), and the linefeed and carriage return characters (U+000D, U+000A, U+000D+U+000A) are to be displayed as is, but the tabulation character (U+0009) is to be displayed as if it were a space. Its syntax is given in Relax NG compact format below.

```
attlist_title_other_info &=
  [ a:defaultValue = "preserve" ]
  attribute xml:space { "default" | "preserve" }?
```

<author\_info> Stores the information related to the author. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

```
author_info = element author_info { attlist_author_info, author+ }
attlist_author_info &= empty
```

#### [Child elements]

<author>

Registers each author. Its syntax is given in Relax NG compact format below and explained in the following text.

```
author =
  element author {
    attlist_author,
    (personal_name | organization_name),
    address_info?,
    author_other_info?
  }
attlist_author &=
  [ a:defaultValue = "author" ]
  attribute role {
    "author"
    | "editor"
    | "translator"
    | "supervisor"
    | "designer"
```

```
| "photographer"
| "illustrator"
| "binder"
| "planner"
| "other"
}?
```

#### [Attribute]

role:

Defines the role of the person mentioned. The possible values are listed below. If omitted, it defaults to "author".

"author", "editor", "translator", "supervisor", "designer", "photographer", "illustrator", "binder", "planner", "other"

#### [Child elements]

<personal name> / <organization name>

Records the author's name in one of these two elements, according to whether the author is an individual or an organization, respectively written as a Personal\_name or Organization\_name.

The details of the corganization\_name> elements are given in A.3.20 and A.3.21, respectively.

<address\_info> Address of the author, written in the Address data format.

May be omitted. The details of the <address\_info> element are given in A.3.22.

<author\_other\_info> Other information related to the author may be stored as an External character string in this element. May be omitted. If the information is to be displayed, the space character (U+0020), and the linefeed and carriage return characters (U+000D, U+000A, U+000D+U+000A) are to be displayed as is, but the tabulation character (U+0009) is to be displayed as if it were a space. Its syntax is given in Relax NG compact format below.

```
author_other_info =
  element author_other_info { attlist_author_other_info, TextWithGaiji }
attlist_author_other_info &=
  [ a:defaultValue = "preserve" ]
  attribute xml:space { "default" | "preserve" }?
```

```
publisher_info =
 element publisher_info {
  attlist_publisher_info,
  ((publisher, publisher_office) | publisher | publisher_office),
  publisher_other_info?
attlist_publisher_info &= empty
              [Child elements]
                 <publisher>
                                Stores the information about the publisher if it is an
                                individual. May be omitted. Its syntax is given in Relax NG
                                compact format below and explained in the following text.
                 publisher =
                  element publisher { attlist_publisher, publisher_name, address_info? }
                 attlist_publisher &= empty
                                [Child elements]
                               <publisher_name> The name of the publisher is recorded as
                                                  an External character string in this
```

element. Shall not be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

below and explained in the following text.

#### [Attribute]

reading: gives the pronunciation

of the publisher's name as a Reading. May be

omitted.

<address info>

Stores the address of the publisher, in the standard Address format. May be omitted. The details of the <address\_info> element are given in A.3.22.

<publisher\_office> Stores the information about the publisher if it is a company. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

element publisher\_office {

```
attlist publisher office, organization name,
                                address info?
                                 }
                                attlist publisher office &= attribute publisher code { text }?
                                [Attribute]
                                    publisher_code: Records the publisher's ID. May be
                                                     omitted.
                                [Child elements]
                                  <organization_name> The
                                                                organization's
                                                  recorded in the element. May be omitted.
                                                  The details of the <organization_name>
                                                  element are given in A.3.21.
                                  <address info> The publisher's address is recorded in
                                                  this element, in the standard Address
                                                  format. May be omitted. The details of
                                                  the <address_info> element are given in
                                                  A.3.22.
                 <publisher other info> Other information related to the publisher may be
                                stored as an External character string in this element. May
                                be omitted. If the information is to be displayed, the space
                                character (U+0020), and the linefeed and carriage return
                                characters (U+000D, U+000A, U+000D+U+000A) are to be
                                displayed as is, but the tabulation character (U+0009) is to
                                be displayed as if it were a space. Its syntax is given in
                                Relax NG compact format below.
                 publisher_other_info =
                  element publisher_other_info {
                   attlist_publisher_other_info, TextWithGaiji
                  }
                 attlist_publisher_other_info &=
                  [ a:defaultValue = "preserve" ]
                  attribute xml:space { "default" | "preserve" }?
<seller_info>
               Stores the information related to the seller. May be omitted. If <seller_info>
               is specified, at least one of <seller> or <seller office> shall be specified as
               well. Its syntax is given in Relax NG compact format below and explained in
               the following text.
seller info =
 element seller info {
  attlist_seller_info,
  ((seller, seller_office) | seller | seller_office),
```

```
seller_other_info?
attlist_seller_info &= empty
              [Child elements]
                 <seller>
                                 Stores the information about the seller if it is an individual.
                                 May be omitted. Its syntax is given in Relax NG compact
                                 format below and explained in the following text.
                 seller = element seller { attlist_seller, seller_name, address_info? }
                 attlist_seller &= empty
                                [Child elements]
                                  <seller name> The name of the seller is recorded as an
                                                  External character string in this element.
                                                  Shall not be omitted. Its syntax is given
                                                  in Relax NG compact format below and
                                                  explained in the following text.
                                  seller_name = element seller_name { attlist_seller_name,
                                                  TextWithGaiji }
                                  attlist_seller_name &= attribute reading { text }?
                                                 [Attribute]
                                                   reading:
                                                                   gives the pronunciation
                                                                   of the seller's name as
                                                                      Reading. May be
                                                                   omitted.
                                  <address_info> Stores the address of the seller, in the
                                                  standard Address format. May be omitted.
                                                  The details of the <address info>
                                                  element are given in A.3.22.
                 <seller_office> Stores the information about the seller if it is a company.
                                 May be omitted. Its syntax is given in Relax NG compact
                                 format below and explained in the following text.
                 seller_office =
                  element seller_office {
                   attlist_seller_office, organization_name, address_info?
                  }
                 attlist seller office &= attribute seller code { text }?
```

seller\_code: Records the seller's ID. May be omitted.

## [Child elements]

<address\_info> Records the seller's address, written in the standard Address format. May be omitted. The details of the <address\_info> element are given in A.3.22.

<seller\_other\_info> Other information related to the seller may be stored as an External character string in this element. May be omitted. If the information is to be displayed, the space character (U+0020), and the linefeed and carriage return characters (U+000D, U+000A, U+000D+U+000A) are to be displayed as is, but the tabulation character (U+0009) is to be displayed as if it were a space. Its syntax is given in Relax NG compact format below.

```
seller_other_info =
  element seller_other_info { attlist_seller_other_info, TextWithGaiji }
attlist_seller_other_info &=
  [ a:defaultValue = "preserve" ]
  attribute xml:space { "default" | "preserve" }?
```

<book\_id\_info> Records the book's identification number, such as its ISBN number. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

```
book_id_info = element book_id_info { attlist_book_id_info, book_id+ }
attlist_book_id_info &= empty
```

### [Child elements]

<book id>

Each type of identification number is stored in a <book\_id> element, written as a Standard character string. When <book\_id\_info> is not omitted, there shall be at least one <book\_id>. Its syntax is given in Relax NG compact format below and explained in the following text.

```
book_id = element book_id { attlist_book_id, text }
attlist_book_id &= attribute type { text }
```

#### [Attribute]

type:

Specifies the type of the identification number, such as "ISBN" for instance.

Written as a Standard character string. Shall not be omitted.

<classification\_info> Stores information on the classification of the book. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

```
classification_info =
  element classification_info {
    attlist_classification_info, classification+
  }
attlist_classification_info &= empty
```

# [Child elements]

<classification> Each different type of classification is stored in a separate <classification> element. When <classification\_info> is not omitted, there shall be at least one <classification>. It is stored as an External character string. Its syntax is given in Relax NG compact format below and explained in the following text.

```
classification =
  element classification { attlist_classification, TextWithGaiji }
attlist_classification &= attribute type { text }
```

## [Attribute]

type: type of the classification used. Shall not

be omitted.

Allows to rate the contents as violent, or adult. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

```
rating = element rating { attlist_rating, empty }
```

attlist\_rating &=

<rating>

[ a:defaultValue = "no" ] attribute adult { Yes\_No }?,

[ a:defaultValue = "no" ] attribute violence { Yes\_No }?

[Attributes]

adult: Rates the contents as adult oriented materials. Possible

values are "yes" or "no". Defaults to no in case of omission.

violence: Rates the contents as violent. Possible values are "yes" or

"no". Defaults to no in case of omission.

```
explained in the following text. Each relevant date is to be stored in
               separate instances of the following child element.
publication_date_info =
 element publication_date_info {
  attlist_publication_date_info, publication_date+
}
attlist_publication_date_info &= empty
              [Child elements]
                 <publication date>
                                          Stores a date relevant to the publication, such as
                                 the publication date itself as well as other dates such as
                                 the printing date, or the beginning of sales date, etc. Each
                                 date is stored in the standard Date format. If
                                 <publication_date_info> is not omitted, there shall be at
                                 least one <publication_date>. Its syntax is given in Relax
                                 NG compact format below and explained in the following
                 publication date =
                  element publication_date { attlist_publication_date, text }
                 attlist publication date &=
                  [ a:defaultValue = "publish" ] attribute type { "publish" | "sale" }?
                                [Attribute]
                                  type:
                                                  Specifies what type of date it is. "publish"
                                                  if it is the publication date and "sale" if it
                                                  is the beginning of sales date. If omitted,
                                                  it will default to "publish".
<net price info>
                    Defines the price of the book. May be omitted, if the price is open, or
               not set. Its syntax is given in Relax NG compact format below and
               explained in the following text. More than one price, classified by currency
               and country, may be stored in separate instances of the following child
               element.
net price info =
 element net_price_info { attlist_net_price_info, net_price+ }
attlist_net_price_info &= empty
              [Child elements]
                 <net_price>
                                 Stores a price specific to one country and currency,
                                 written as a Standard character string. If <net price info>
                                 is not omitted, there shall be at least one <net price>. Its
                                 syntax is given in Relax NG compact format below and
                                 explained in the following text.
                 net_price = element net_price {    attlist_net_price, text }
                 attlist net price &=
                  attribute country { text }?,
                  attribute unit { text },
                  attribute other_info { text }?
                                [Attributes]
                                  country:
                                                  Defines the country in which this price
```

should apply, in the standard Country

data format. If omitted, it applies to all

countries.

unit: Defines the currency, as a Standard

character string. Shall not be omitted.

other\_info: Other information, written as a Standard

character string. May be omitted.

<book\_abstract> An abstract of the book, written as an External character string, is recorded in this element. May be omitted. If the information is to be displayed, the space character (U+0020), and the linefeed and carriage return characters (U+000D, U+000A, U+000D+U+000A) are to be displayed as is, but the tabulation character (U+0009) is to be displayed as if it were a space. Its syntax is given in Relax NG compact format below.

```
book_abstract =
  element book_abstract { attlist_book_abstract, TextWithGaiji }
attlist_book_abstract &=
  [ a:defaultValue = "preserve" ]
  attribute xml:space { "default" | "preserve" }?
```

<front\_cover\_image> Defines the image to use as front cover image, by recording its location as a standard Filename. Currently, jpeg and png images are supported. May be omitted. The file type as defined by it shall be checked against the type attribute before opening the file. Its syntax is given in Relax NG compact format below and explained in the following text.

```
front_cover_image =
  element front_cover_image { attlist_front_cover_image, text }
attlist_front_cover_image &= attribute type { text }
```

[Attribute]

type: Defines the type of the image, by giving its MIME type, for

example "image/jpeg". Shall not be omitted.

<spine\_cover\_image> Define the image to use as a spine image. Follows the same
 rules as <front\_cover\_image>. May be omitted. Its syntax is given in Relax
 NG compact format below.

```
spine_cover_image =
  element spine_cover_image { attlist_spine_cover_image, text }
attlist_spine_cover_image &= attribute type { text }
```

<keyword\_list> Records a list of keywords related to the book's data, written in the Keyword syntax. May be omitted. Its syntax is given in Relax NG compact format below.

```
keyword_list = element keyword_list { attlist_keyword_list, keyword+ }
attlist_keyword_list &= empty
```

<other\_book\_info> Other information related to the book may be stored as an External character string in this element. May be omitted. If the information is to be displayed, the space character (U+0020), and the linefeed and carriage return characters (U+000D, U+000A, U+000D+U+000A) are to be displayed as is, but the tabulation character (U+0009) is to be displayed as if it were a space. Its syntax is given in Relax NG compact format below.

```
other_book_info =
  element other_book_info { attlist_other_book_info, TextWithGaiji }
attlist_other_book_info &=
  [ a:defaultValue = "preserve" ]
  attribute xml:space { "default" | "preserve" }?
```

```

# A.4.3 Content management module <body\_module>

#### A.4.3.1 General

The content management module (<body\_module>) is in charge of coordinating the contents data into making the actual document. Its syntax is given in Relax NG compact format below and explained in the following text.

```
body_module =
  element body_module { attlist_body_module, flow_type_body }
attlist_body_module &= empty

[Attribute]

None.

[Child elements]
  <flow_type_body> Handles the flowing contents' data. See A.4.3.2 for details.

Example:
```

# A.4.3.2 Flowing content data <flow\_type\_body>

# A.4.3.2.1 <flow\_type\_body> element

The <flow\_type\_body> element handles the flowing contents' data. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flow_type_body =
  element flow_type_body {
   attlist_flow_type_body,
```

```
flow_entry,
  special page link?,
  search_table?
 }
attlist_flow_type_body &= empty
[Attribute]
  None.
[Child elements]
  <flow_entry>
                        Registers the flow data to be used as the main text's flowing content.
                        There shall only be one instance of this element. Shall not be
                        omitted. See A.4.3.2.2 for details.
  <special_page_link>
                        Special page data. Allows specifying the position in the flowing
                        content of some often needed pages, such as the index, or the
                        beginning of the main content, for easy reference. May be omitted.
                        Written as described in A.4.3.2.5. Omission of this element means
                        there is no special page.
                        Records the data needed to create a search table. May be omitted.
  <search_table>
                        Written as described in A.4.3.2.6. Omission of this element means
                        there is no search table.
```

# A.4.3.2.2 Flow data registering module <flow\_entry>

The <flow\_entry> element registers the flow data to be used as the main text's flowing content. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flow_entry =
  element flow_entry {
    attlist_flow_entry, flow_default_attribute?, flow_data+
  }
attlist_flow_entry &= empty
[Child elements]
```

<flow\_default\_attribute>

Sets the default attributes to be used to display each flow data, as defined by the following <flow\_data> element. May be omitted. See A.4.3.2.3 for details. When omitted, the viewer should behave as if all of its attributes and child elements were set to their default value.

<flow\_data>

Registers information on each flow data. There is a one to one relation between the number of <flow\_data> elements and actual flow data to be recorded/displayed. There shall be one or more instances of this element. The order in which flow data are recorded determines the display order. See A.4.3.2.4 for details.

# A.4.3.2.3 Flow data default attribute module <flow\_default\_attribute>

Sets the default values of attributes that will be used to display each flow data (see A.4.3.2.4), of which the main flowing content is composed. The values set in this element will serve as default values for all the flows which have a text object, a search screen object or dictionary data object as main data.

Part of the values that may be set in this element may also be set locally in the text object instance of each content data. In order to set a default value for particular content data, the <text\_default\_attribute> of the text object instances (see A.4.6.2) or <dict\_default\_attribute> of the dictionary data object designated by the content data should be used. If the value defined by the <flow\_default\_attribute> element for the whole content data and the value set in an individual content data's <text\_default\_attribute> or <dict\_default\_atribute> are in conflict, the latter has priority. When neither is set, the behavior is not defined by this annex, and depends on the viewer's default, or the user's preferences. Moreover, if the viewer does not implement the required method, or wishes to give priority to user settings, it may proceed without respecting the value defined in these default value elements, except when the following explanations state otherwise.

The syntax of the <flow\_default\_attribute> element is given in Relax NG compact format below and explained in the following text. If it is omitted, the viewer should behave as if all of its attributes and child elements were set to their own default value.

```
flow_default_attribute =
  element flow_default_attribute {
    attlist_flow_default_attribute,
    flow_default_size?,
    flow_default_font?,
    flow_default_background?,
    flow_default_line_breaking_method?
  }
attlist_flow_default_attribute &=
    attribute baseline { BaseLine }?,
    attribute view_type { ViewType }?,
    [ a:defaultValue = "IPA" ] attribute phonetic_notation { text }?
```

baseline:

Defines the orientation of the baseline (and therefore of the text) for each flow. The possible values are listed below. May be omitted. If neither this attribute nor the corresponding option in each content data (the baseline attribute of the <text\_default\_attribute> element in text object instance or <dict\_default\_attribute> in dictionary data object instance, see A.4.6.2.2 and A.4.6.3.2 for details) is set, the default value depends on the viewer.

The writing direction is horizontal (left to right). However, "right":

the direction can be changed at the user's option.

The writing direction is horizontal (left to right), and the "right only":

> user cannot change the setting. However, if it is not supported by the viewer, this setting is not necessarily

applied.

"down": The writing direction is vertical (top to bottom). However,

the direction can be changed at the user's option.

The writing direction is vertical (top to bottom), and the "down only":

> user cannot change the setting. However, if it is not supported by the viewer, this setting is not necessarily

applied.

view\_type:

Defines the default screen orientation for each flow. The possible values are listed below. May be omitted. When omitted, the default value depends on the viewer.

Chooses portrait (taller than wide) mode. However, it can "portrait":

be set to another direction at the user's option.

"portrait only": Chooses portrait (taller than wide) mode, and the user

cannot change the setting. However, if the viewer cannot handle this screen orientation, this is not necessarily

applied.

"landscape": Chooses landscape (wider than tall) mode. However, it

can be set to another direction at the user's option.

"landscape only": Chooses landscape (wider than tall) mode, and the user

cannot change the setting. However, if the viewer cannot handle this screen orientation, this is not necessarily

applied.

phonetic notation: Defines the default pronunciation notation of the content. Defaults to "IPA". This is overridden by the phonetic notation attribute of oronunciation> and <headword> elements inside such elements.

### Example:

<flow\_default\_attribute base\_line="right" view\_type="portrait>

#### [Child elements]

<flow\_default\_size> Defines the default letter spacing, line pitch and margin size for all the flows of the content data. May be omitted. If it is, the viewer should behave as if all of its attributes were set to their default value. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flow_default_size =
 element flow_default_size { attlist_flow_default_size, empty }
attlist_flow_default_size &=
 attribute letter_spacing { FiveSize }?,
 attribute line_pitch { FiveSize }?,
 attribute margin { "big" | "medium" | "small" }?
```

letter spacing: Default letter spacing. The following values are allowed. May be omitted. If it is, the size is unspecified and depends on the viewer.

"maximum"

"big"

"medium"

"small"

"minimum"

The actual sizes of these 5 possibilities are viewerdependent, as it depends on the capabilities of the underlying device.

line pitch:

Default line pitch. The following values are allowed. May be omitted. If it is, the size is unspecified and depends on the viewer.

"maximum"

"big"

"medium"

"small"

"minimum"

The actual sizes of these 5 possibilities are viewerdependent, as they depend on the capabilities of the underlying device.

margin:

Default margin size. The following values are allowed. May be omitted. If it is, the size is unspecified and depends on the viewer.

"big"

"medium"

"small"

The actual sizes of these 3 possibilities are viewerdependent, as they depend on the capabilities of the underlying device.

<flow default font>

Defines the default font name, size, and properties for all the flows of the content data. May be omitted. If an individual flow of the content data also defines it (with the <text\_default\_font> element of the text object instance, as defined in A.4.6.2.2 and <dict\_default\_font> element of the dictionary data object instance as defined in A.4.6.3.2, the individual values take precedence. If both are omitted, the behavior should correspond to the default value of the attributes listed below. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flow_default_font =
 element flow_default_font { attlist_flow_default_font, empty }
attlist_flow_default_font &=
 attribute fontname { text }?,
 attribute fontsize { FiveSize }?,
 attribute bold_flag { Yes_No }?,
 attribute color_space { "RGB" }?,
 attribute opacity { "100" }?,
 attribute color { text }?,
 attribute ruby_flag { "yes" | "yes_only" | "no" | "no_only" }?,
 attribute italic { Yes_No }?,
 attribute oblique { Yes_No }?,
 attribute small_caps { Yes_No }?,
 attribute family {
   "monospace" | "san-serif" | "serif" | "cursive" | "fantasy"
 }?,
 attribute ul_type { "rightscore" | "leftscore" | "throughscore" }?,
 attribute em_type {
   "rightscore"
   | "leftscore"
   | "throughscore"
   | "kendot"
   | "bold"
   | "italic"
   | "bold_italic"
   | "reverse"
   | "shade"
 }?
```

fontname:

Default font name. More than one font may be specified. In that case, each font name should be separated by a comma (U+002C). For instance:

offilia (0 10020). For instance.

fontname="Aaa sans serif,Bbb gothic"

The viewer should use the first listed font that is available. May be omitted. If both this attribute and the individual flow's attribute are omitted, the default value depends on the viewer.

fontsize:

Default font size. The following values are allowed. May be omitted. If it is, the size is unspecified and depends on the viewer.

"maximum"

"big"

"medium"

"small"

"minimum"

The actual letter sizes corresponding to these 5 possibilities are viewer-dependent, as it depends on the capabilities of the underlying device.

bold\_flag:

Specifies if the content data should be displayed in bold or not. If omitted, the behavior depends on the viewer. The acceptable values are:

"yes": display as bold "no": display normally

If set to "yes", all characters shall be displayed in bold style, except, in a text object instance or a dictionary data object instance, those within a <font> element with its bold flag attribute set to "no" (see A.4.6.2.3 and A.4.6.3.4).

color\_space, color, opacity:

Defines the font color to be used for the content data. Written in the standard color data type. If omitted, the value depends on the viewer.

ruby\_flag:

Defines whether ruby in the content data is to be viewed or not. When omitted, behavior depends on the viewer. The text to be displayed when ruby is turned on is the one included in the <ruby> element of text object instances or dictionary data object instances. The following values may be used.

"yes": Ruby should be displayed, but can be

turned off by the user.

"yes\_only": Ruby shall be displayed, and cannot be

turned off by the user. However, this does not apply to viewers not able to

display ruby.

"no": It is recommended that ruby should not

be displayed, but can still be turned on

by the user.

"no\_only": Ruby shall not be displayed, and cannot

be turned on by the user. However, this

does not apply if the viewer is incapable

italic:

Decides if the content data should be displayed in italic or not. If omitted, the behavior depends on the viewer. The acceptable values are:

"yes": display in italic
"no": display normally

If set to "yes", all characters shall be displayed in italic style, except, in a text object instance or a dictionary data object instance, those within a <font> element with its italic attribute set to "no" (see A.4.6.2.3 and A.4.6.3.4).

oblique:

Decides if the content data should be displayed in oblique or not. If omitted, the behavior depends on the viewer. The acceptable values are

"yes": display in oblique; "no": display normally.

If set to "yes", all characters shall be displayed in oblique style, except, in a text object instance or a dictionary data

object instance, those within a <font> element with its oblique attribute set to "no" (see A.4.6.2.3 and A.4.6.3.4).

small\_caps:

Decides if the content data should be displayed in small capitals or not. If omitted, the behavior depends on the viewer. The acceptable values are

"yes": display in small capitals;

"no": display normally.

If set to "yes", all characters shall be displayed in small capitals, except, in a text object instance or a dictionary data object instance, those within a <font> element with its small\_caps attribute set to "no" (see A.4.6.2.3 and A.4.6.3.4).

family:

Specifies font family to be used. The font actually used in rendering depends on the viewer. If omitted, the behavior is also viewer-dependent. The acceptable values are

"monospace": display in fixed-width fonts;

"sans-serif": display in fonts without serifs;
"serif" display in fonts with serifs;

"cursive" display in handwriting-style fonts.

"fantasy"

Specifies in decorative fonts. If set to "yes", all characters shall be displayed in decorative style, except, in a text object instance or a dictionary data object instance, those within a <font> element with its fantasy\_flag attribute set to "no" (see A.4.6.2.3 and A.4.6.3.4).

ul\_type

Specifies how strings in <u> element and its equivalent (<font underline="yes">) should be rendered. The acceptable values are as follows, all of which are taken from ISO/IEC 9541-1:2012 (8.7.1.12.1.1 Score Name). Refer to ISO/IEC 9541-1:2012 for the exact meaning of these values.

"rightscore"

"leftscore"

"throughscore"

em\_type:

Specifies how strings in <em> elements should be rendered. The acceptable values are as follows, the first four of which are taken from ISO/IEC 9541-1:2012 (8.7.1.12.1.1 Score Name). Refer to ISO/IEC 9541-1:2012 for the exact meaning of these values.

Note that when this attribute is specified, <em> element is no longer equivalent to <font bold="yes" italic="yes">.

"rightscore"

"leftscore"

"throughscore"

"kendot"

"bold": The substrings should be rendered in bold font.

"italic": The substrings should be rendered in italic font.

"bold\_italic" The substrings should be rendered in bold italic font.

"reverse" The substring should be rendered with the characters and background reversed.

"shade" The substrings should be rendered with shade.

<flow\_default\_background> Defines the background color to be used for all the flows of the content data. If an individual flow of the content data also defines it (with the <text\_default\_font> element of the text object instance, as defined in A.4.6.2.2 or with the <dict\_default\_font> element of the dictionary data object instance as defined in A.4.6.3.2, the individual values take precedence. If both are omitted, the behavior should correspond to the default value of the attributes listed below. Its syntax is given in Relax NG compact format below and explained in the following text.

Defines the font color to be used for the content data. Written in the standard color data type. If omitted, the value depends on the viewer.

<flow\_default\_line\_breaking\_method> Specifies the algorithm to be used to determine how text should be split in lines. Various languages handle this in various ways, so this element allows for some flexibility. May be omitted. If both this element and line\_breaking\_method> elements in the text/dictionary data object instance (defined in A.4.6.2.2 and A.4.6.3.2 are specified, the latter takes priority. If both are omitted, the default values of this <flow\_default\_line\_breaking\_method> element define the behavior. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flow_default_line_breaking_method =
  element flow_default_line_breaking_method {
    attlist_flow_default_line_breaking_method, empty
  }
attlist_flow_default_line_breaking_method &=
  [ a:defaultValue = "none" ] attribute method { "none" }?
```

### [Attributes]

method: Chooses the line breaking method. Defaults to "none".

Possible values are:

"none": no special processing. When a line is filled with characters, go to the next one.

Other values are possible for localization. See Clause A.6 for details.

Other attributes may be added by localized methods. See Clause A.6 for details.

[Child elements]

None, unless added by localized methods. See Clause A.6 for details.

<flow default delimiter> Specifies the block for delimiters (character strings that appear before the first character and after the last character) for various elements in the content. Its child elements are elements that specify such delimiters for some elements, which serve as a guide when the content is converted into the data for the viewer, or rendered directly. <flow\_default\_delimiter> may be omitted, and all the delimiters default to "" (empty string) in such cases. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flow_default_delimiter =
 element flow_default_delimiter {
  attlist_flow_default_delimiter, delimiter?
 }
attlist_flow_default_delimiter &= empty
```

[Child elements]

<delimiter> Defines the starting and ending delimiters of the child element of the element specified by the element attribute.

It is also possible to specify the type attribute when applicable (i.e. the element specified has the type attribute). The element shall be ignored if the element attribute specifies a non-text-rendering element. When no delimiter is specified to a element, it is regarded that an empty string "" is specified. The syntax of the <delimiter> element is given in Relax NG compact format below and explained in the following text.

```
delimiter = element delimiter { attlist_delimiter, empty }
attlist_delimiter &=
 attribute tag { text },
 attribute type { text }?,
 [ a:defaultValue = "" ] attribute open { text }?,
 [ a:defaultValue = "" ] attribute close { text }?
```

### [Attributes]

tag: Specifies which element the delimiters

> apply to. Ignored when a non-existing element is specified. Shall not be omitted.

Specifies the value of the type attribute type: of the element which the delimiters apply to. When type attribute is specified to a element that has no type attribute, the

instance of <delimiter> element is ignored. If multiple <delimiter> elements are given, and one of them has the type attribute while the others don't, the former overrides the latter when the former is applicable. May be omitted.

open:

Defines the starting (opening) delimiter. May be omitted and defaults to "" (empty

string).

close:

Defines the ending (closing) delimiter. May be omitted and defaults to "" (empty

string).

[Child elements]

None.

# Example:

```
< flow_default_delimiter>
  <delimiter tag="headword" type="pronunciation" open="/" close="/>
  <delimiter tag="etymology" open="&lt;" close="&gt;"/>
  <delimiter tag="p" open="*"/>
  </ flow_default_delimiter>
```

# A.4.3.2.4 Flow data <flow\_data>

This is where flow data is defined. Under this element, the object to be used as the flow's content is registered, as well as other information such as page links and events. The syntax of the <flow\_data> element is given in Relax NG compact format below and explained in the following text.

```
flow_data = element flow_data { attlist_flow_data, event_info? }
attlist_flow_data &=
attribute flow_id { text }?,
attribute body_id { text },
[ a:defaultValue = "off" ]
attribute turning_page_control { Turn_Page_Val }?
```

## [Attributes]

flow\_id:

Sets the ID number of the flow data, written in the form of a Page\_ID. May be omitted. Within <flow\_entry>, there shall be no other flow data with the same ID.

body\_id:

Points to the object that will constitute this flow's content, using the Object\_ID of a "flowing content text" object, or of a "search page" object, or a dictionary data object. Shall not be omitted.

turning\_page\_control: The viewer allows moving forward or backward in the contents.

However, it is possible to restrict moves to the previous or next flow by setting this attribute to one of the values listed below. When omitted, it defaults to "off". Note, however, that when body id points to a search page object, turning\_page\_control shall be set to "on".

"on": Moving both to the next or previous flows is forbidden.

"off": Moving to the next and previous flows is permitted.

"forward": Moving to the next flow is forbidden, but moving to the

previous one is allowed.

"back": Moving to the next flow is permitted, but moving to the

previous one is forbidden.

As explained above, this setting limits moves from one flow to the others, but they do not restrict moves within each flow. To restrict moves inside a flowing content text object, the turning page control of the cpage\_break element (see A.4.6.2.3) shall be used in flowing content text object and of the <dic-item> element in dictionary data object.

# [Child elements]

<event\_info> Event information module. Defines events (triggers) and associated actions.
May be omitted. See A.4.4 for details.

## A.4.3.2.5 Special page data <special\_page\_link>

Records the position of important or frequently accessed pages, to make it easier to jump to these parts of the document. For instance, easy access to the map in a travel guide, to the chronology in a history book, or the glossary in a technical paper can prove useful. The syntax of the <special\_page\_link> element is given in Relax NG compact format below and explained in the following text.

```
special_page_link =
  element special_page_link { attlist_special_page_link, special_page+ }
attlist_special_page_link &= empty
```

### [Child elements]

<special\_page> Records the information about a single special page. Its syntax is given in Relax NG compact format below and explained in the following text.

```
special_page = element special_page { attlist_special_page, text }
attlist_special_page &=
  [ a:defaultValue = "other" ]
  attribute kind {
```

```
"cover"
 | "title_page"
 | "preface"
 | "contents"
 | "body"
 | "column"
 | "note"
 | "figure"
 | "ad"
 | "afterword"
 | "appendix"
 | "answer"
 | "glossary"
 | "bibliography"
 | "commentary"
 | "index"
 | "imprint"
 | "author_info"
 | "other"
}?,
attribute title { text }?
```

kind:

Describes the contents of the page referred to. The possible values are listed below. Defaults to "other" when omitted.

"cover", "title\_page", "preface", "contents" (table of contents), "body" (beginning of the content), "column" (boxed piece of text), "note", "figure", "ad", "afterword", "appendix", "answer", "glossary", "bibliography", "commentary", "index", "imprint", "author\_info", "other".

title:

Defines a title for the position of the document referred to as a special page. Written as an Extended character string. May be omitted.

# [Child elements]

Standard character string: Specifies the position to consider as a special page, by choosing a particular flow data from the whole flowing content. Shall not be omitted. For a textual flow data, it is possible to specify a position within it as well.

- To specify only the flow data as a whole.

Written as a Page\_ID. It records the corresponding flow data's page ID.

```
<special_page ... >PG0001</special_page>
```

To specify the flow data and the position within it.

Written as "Page\_ID/Object\_ID/Char\_ID". Page ID is the flow data's ID number. Object ID is the ID number of a text/dictionary data object within that flow. Char ID is the ID number of a string defined within that text/dictionary data object.

### Example:

```
<special_page ... >
     PG0001/OB0321/CR0982
</special_page>
```

## Example:

# A.4.3.2.6 Search table data <search\_table>

Information defining the search tables is stored here, such as the search table's ID, or parameters concerning entry words registered in the search table. Entry words hereafter means target of each search and represented in two different ways:

- registered in the <head> element of the text object instance (see A.4.6.2.3);
- registered in the <head> element of the dictionary data object instance (see A.4.6.3.4.)

During the conversion to the distribution format, based on the parameter stored in the <search\_table\_def> element defined below, the actual search table is built, after verification of the entry word strings. In the distribution format, entry words are stored in this search table. The syntax of the <search\_table> element is given in Relax NG compact format below and explained in the following text.

```
search_table =
  element search_table { attlist_search_table, search_table_def+ }
  attlist_search_table &=
   [ a:defaultValue = "no" ] attribute bookmark { Yes_No }?,
   [ a:defaultValue = "no" ] attribute wordbook { Yes_No }?,
   [ a:defaultValue = "no" ] attribute jump_search_root { Yes_No }?,
```

IEC 62605:2016 © IEC 2016

[ a:defaultValue = "no" ] attribute jump\_search { Yes\_No }?,

[ a:defaultValue = "no" ] attribute all\_search { Yes\_No }?

### [Attributes]

bookmark: Specifies if all the search tables included in the content should be eligible for automatic bookmarking on the viewer (i.e. automatically keeping the tally of the headwords searched). The following values are possible. May be omitted and regarded as "no" when omitted.

"yes": the search tables are eligible for automatic bookmarking.

"no": the search tables are not eligible for automatic

bookmarking.

wordbook: Specifies if all the search tables are eligible for the wordbook function on the viewer (i.e. automatically registering headwords in the wordbook and showing the list). The following values are possible. May be omitted and regarded as "no" when omitted.

"yes": the search tables are eligible for wordbook function.
"no": the search tables are not eligible for wordbook function.

jump\_search\_root: Specifies if the content is eligible as a source of multi-content search from text (i.e. can launch multi content search using the keyword selected from the displayed text of the content). The following values are possible. May be omitted and regarded as "no" when omitted.

"yes": the content is eligible as a source of multi-content search

from text.

"no": the content is not eligible as a source of multi-content

search from text.

jump\_search: Specifies if all the search tables are eligible for multi-content search from text (i.e. can be searched as one of the contents in multi-content search using the keyword selected from the text) and multi-content search from input with the content being displayed (i.e. can be searched as one of the contents in multi-content search using the input keyword) with the content displayed. The following values are possible. May be omitted and regarded as "no" when committed.

"yes": the search tables are eligible for such searches.

"no": the search tables are not eligible for such searches.

all\_search: Specifies if all the search tables are eligible for multi-content search without the content itself being displayed. The following values are possible. May be omitted and regarded as "no" when omitted.

"yes": the search tables are eligible for such searches.

"no": the search tables are not eligible for such searches.

If specified in the text object instances, only "no" is valid for bookmark/wordbook/jump\_search\_root/jump\_search/all\_search attributes.

### [Child elements]

Its syntax is given in Relax NG compact format below and explained in the following text.

```
search_table_def =
  element search_table_def {
    attlist_search_table_def, enable_key_type, key_normalization
}
attlist_search_table_def &=
  attribute id { text },
  [ a:defaultValue = "no" ] attribute use_default { Yes_No }?,
  [ a:defaultValue = "unicode" ] attribute sorting_rule { "unicode" }?,
  attribute name { text },
  attribute short_name { text },
  attribute wild { Yes_No },
  attribute blank { Yes_No },
  attribute end { Yes_No },
  attribute help_page_id { text }?
```

# [Attributes]

id:

Defines the ID number of this search table. The ID number shall be unique to each search table within the content and stored as a Standard character string. Shall not be omitted. During the conversion to the distribution format, the search table is built according to the parameters in this <search\_table\_def> element, and added to the contents. This ID number is used to refer to the search table either from the search page's entry fields (see A.4.6.7 for details) or from the entry word information stored in text object instance's <head> element (see A.4.6.2.3 for details). Not to be confused with Reference ID (see A.4.6.3.4).

use\_default:

Defines whether a search based on this search table is allowed by the viewer, when the search is not initiated from a related search page. The following values may be used. Defaults to "no" when omitted.

"yes" such search is allowed.

"no" such search is not allowed.

sorting\_rule:

Defines how to sort the search results. This attribute is to allow for different ordering schemes for different languages. May be omitted. Defaults to "unicode". The following values may be used.

"unicode": The rank of each character is determined by its Unicode code point.

Other sorting methods are defined in the localization (see A.6.5).

name:

Sets the name for the search table. Written in a Standard character string. The name is intended to be used in listing the search results. Shall not be omitted.

short\_name: Sets the shortened version of the name of the table.

Names longer than the one specified by the name attribute are not allowed. The name is intended to be used in listing

the search results. Shall not be omitted.

wild: Specifies if the search table for wildcard search (i.e. it is

known how many letters need to be filled in the blanks of the word as well as the positions of the blanks) should be output. The following values are possible. Shall not be

omitted.

"yes" the table for wildcard search should be

output.

"no" otherwise.

blank: Specifies if the search table for blank word search (where

only the positions of the blanks in the word are known) should be output. The following values are possible. Shall

not be omitted.

"yes" the table for blank word search should be

output.

"no" otherwise.

end: Specifies if the search table for word ending search should

be output. The following values are possible. Shall not be

omitted.

"yes" the table for word ending search should

be output.

"no" otherwise.

help\_page\_id: Specifies the page ID for the flow data that are related to

the table (e.g. explanation of the table). May be omitted.

### [Child elements]

<enable\_key\_type> Defines the type of characters that may be used
to store the lookup key of the entry words in the table. For

to store the lookup key of the entry words in the table. For some languages such as English, the lookup key will simply be the word itself. However, other languages such as Japanese may use the pronunciation of the word instead of its ideographic representation. Shall not be omitted. Its syntax is given in Relax NG compact format

below and explained in the following text.

enable\_key\_type =

element enable\_key\_type { attlist\_enable\_key\_type, empty }

attlist\_enable\_key\_type &=

[ a:defaultValue = "no" ] attribute numerals { Yes\_No }?,

[ a:defaultValue = "no" ] attribute basic alphabet { Yes No }?

### [Attributes]

numerals: Defines whether the lookup key may

include numerals or not. Possible values are "yes" and "no". Defaults to "no" when

omitted.

basic\_alphabet:Defines whether the lookup key may include alphabet (limited to the non-accentuated characters found in US-ACSII) or not. Possible values are "yes" and "no". Defaults to "no" when omitted.

Refer to A.6.6 on localization for language-specific attributes. The character sets above are defined in Table A.5.

Table A.5 – Characters usable for the lookup key

Character set name	Corresponding characters (all values are in Unicode)
numerals	numerals: 0 to 9 (U+0030 to U+0039)
basic_alphabet	Standard US-ACSII alphabet:
	A to Z (U+0041 to U+005A) and
	a to z (U+0061 to U+007A)

<key\_normalization> Defines the normalization methods to be applied on the keys registered in this search table. Shall not be omitted. The interpretation of this element differs depending on the modes of the search, namely "matchesonly" search and "matches-first" search. The mode of search to use is determined by the search\_type attribute of the <key\_input\_region> element (see A.4.6.7 for details).

### a) "matches-only" search

(Only the entries matching the input are displayed, being narrowed down as input is becoming complete.) Both user input and the keys registered in the search table are normalized according to the rules set by the following attribute, and matching is conducted on the normalized form.

#### b) "matches-first" search

(Entries are displayed starting from those matching the input.) The settings are ignored and the normalization is done according to the default values of the following attributes.

The syntax of the <key\_normalization> element is given in Relax NG compact format below and explained in the following text.

```
key_normalization =
  element key_normalization { attlist_key_normalization, empty }
attlist_key_normalization &=
  [ a:defaultValue = "yes" ] attribute capitalization { Yes_No }?
```

# [Attribute]

capitalization: Turn all (alphabetical) characters to upper case. Possible values are "yes" and "no". Defaults to "yes".

See A.6.7 for language specific normalizations.

# A.4.4 Event info module <event\_info>

#### A.4.4.1 Events

In this annex, audio playback to react to clicks, pages links, or other user activated functions, are called events. The <event\_info> element records the events of flow data. Its syntax is given in Relax NG compact format below and explained in the following text.

```
event_info = element event_info { attlist_event_info, event+ }
attlist_event_info &=
  [ a:defaultValue = "single" ] attribute display_type { "single" }?
```

# [Attribute]

display\_type:

Specifies environments for the events. Currently only "single" is possible.

Defaults to "single" when omitted.

### [Child elements]

<event>

Event data. Records information concerning the events that occur after the object pointed by the body\_id attribute of the <flow\_data> element has been displayed, such as user launched events. For instance, clicking on a string may initiate a jump to another page. See A.4.4.2 for details. There may be more than one instance of this <event> element within <event\_info>. If no event is to be specified, the <event info> element itself shall be omitted.

```
<event_info display_type="single">
  <event>
         <trigger>
                <trigger pointer id="OB0001/CR0001" action flag="click"/>
         </trigger>
         <action>
                <action page jump page id="PG0002"/>
         </action>
  </event>
                                                                   Event 1
  <event>
         <trigger>
                <trigger pointer id=" OB0001/CR0002" action flag="click"/>
         </trigger>
         <action>
                 <action_page_jump page_id="PG0003"/>
         </action>
  </event>
                                                                   Event2
</event info>
```

#### A.4.4.2 Event data <event>

An event is composed of two parts: the trigger part, and the action part. The former is the condition that triggers the event while the latter describes what is to be done. For example, the trigger may be "the user clicks on a specific area", or "a button is pressed", and the action may be "jump to a specific page", or "play a given soundfile". The syntax of the <event> element is given in Relax NG compact format below and explained in the following text.

```
event = element event { attlist_event, trigger, action }
attlist_event &= empty
```

# [Child elements]

<trigger> See A.4.4.3 for details. There shall be only one <trigger> element, and it

can have only one child element. Shall not be omitted.

<action> See A.4.4.4 for details. There shall be only one <action> element, and it

can have only one child element. Shall not be omitted.

# A.4.4.3 Trigger (pointer) <trigger\_pointer>

The syntax of the <trigger> element is given in Relax NG compact format below and explained in the following text.

id="OB003k/CR0023"

Example:

The char ID part of this string may only refer to the following (see A.4.6.2.3 for details):

- a) the id number defined in the char\_id attribute of a <char\_id> element;
- b) the id number defined in the char\_id attribute of an <object> element.

However, when a clickable image map is defined using the <pointer\_region> element, only the second case (char\_id of an <object> element) may be used.

Note that the id number set in the trigger attribute of a <mask> element (see A.4.6.2.3) shall not be used here. If used, the trigger attribute of the <mask> element is ignored.

action\_flag:

The type of action which switches the trigger on. In the current standard, only "click" is allowed, and is used as a default value in case of omission.

"click": a click in the target zone.

### [Child elements]

<pointer\_region> When the trigger area is restricted to only a part of the image pointed to by the id attribute of the <trigger\_pointer> element, this <pointer\_region> element is used to describe a Polygonal\_region (see A.3.15). If what the id attribute of the <trigger\_pointer> points to is not an image, the content of this element is ignored. May be omitted. Its syntax is given in Relax NG compact format below.

```
pointer_region =
  element pointer_region { attlist_pointer_region, vertex+ }
attlist_pointer_region &= empty
```

When events have overlapping triggers, there can be some ambiguity as to which event takes precedence when the overlapping areas are clicked, depending on what kind of pointing devices are used. In that case, events are given precedence in the order of appearance inside the <event info>. The following example illustrates this situation.

```
<event_info>
       <event>
              <trigger>
                      <trigger_pointer id="OB003k/CR0001" action flag="click">
                             <pointer region>
                                     <vertex position="(0,0)"/>
                                     <vertex position="(100,0)"/>
                                     <vertex position="(100,100)"/>
                                     <vertex position="(0,100)"/>
                             </pointer_region>
                      </trigger_pointer>
              </trigger>
              <action>
                      <action page jump page id="PG0043"/>
              </action>
       </event>
       <event>
              <trigger>
                      <trigger_pointer id="OB003k/CR0001" action_flag="click">
                             <pointer region>
                                     <vertex position="(50,50)"/>
                                     <vertex position="(100,50)"/>
                                     <vertex position="(100,100)"/>
                                     <vertex position="(50,100)"/>
                             </pointer region>
                      </trigger_pointer>
              </trigger>
              <action>
                      <action_page_jump page_id="PG0021"/>
              </action>
       </event>
</event info>
```

In that case, both events are triggered by a click on a sub-area of OB003k/CR0001. These two areas overlap on the (50,50)-(100,100) square. A click in this particular area shall trigger the first of the two events, resulting in a page jump to PG0043.

### A.4.4.4 Action information

### A.4.4.4.1 <action> element

The syntax of the <action> element is given in Relax NG compact format below. It can only have one instance of its child element.

```
action = element action { attlist_action, Action_List }
attlist_action &=
  [ a:defaultValue = "sequential" ]
  attribute action_flag { "sequential" }?
```

# A.4.4.4.2 Playback action <action\_play>

Launches the playback of a sound, and animation or other playable items. Its syntax is given in Relax NG compact format below and explained in the following text.

```
action_play = element action_play { attlist_action_play, empty }
attlist_action_play &=
  attribute object_id { text },
  [ a:defaultValue = "normal" ] attribute action { "normal" }?
```

# [Attributes]

object\_id:

Points to the object to be played. Written as described below. Shall not be omitted.

If the object is registered in the object management table (see A.4.5) (in this edition of IEC 62605, only possible for sound and movie objects), then it is:

Written as an Object ID.

# Example:

```
object_id="OB003k"
```

If the object is inserted in the text/dictionary data object instance by the <object> element (in this edition of IEC 62605, only possible for animations), then it is:

Written as Object ID/Char ID.

# Example:

```
object_id="OB003k/CR0023"
```

Note that the char ID part shall be an id number registered in the char\_id attribute of an <object> element (A.4.6.2.3).

action:

Defines the playback method. The only accepted value is "normal", and it defaults to "normal" in case of omission. When the object to be played is a sound item, when the reader moves to another flow, or reaches a <page\_break>, or </word> with page\_break attribute set to "yes" (in dictionary data object instances only), the playback shall be stopped. In case of an animation, the playback stops when it goes out of the screen.

## Example:

```
<action_play object_id="OBkj23"/>
<action_play object_id="OB1234/CR0001"/>
<action_play object_id="OB1234/CR0001" action="normal"/>
```

## A.4.4.4.3 Page jump action <action\_page\_jump>

This elements defines a jump form the current page to another one, or to a website. Its syntax is given in Relax NG compact format below and explained in the following text.

```
action_page_jump =
  element action_page_jump { attlist_action_page_jump, empty }
attlist_action_page_jump &=
  attribute book { text }?,
  attribute book_type { text }?,
  attribute page_id { text }?,
  attribute center { text }?
```

## [Attributes]

book:

Defines the target document of the jump. If it is the same document as the origin, this attribute should be omitted. Otherwise, there are 3 different usages as listed below.

a) Jump to a website:

When the target is an html website, the book attribute should be written as a URL address beginning with http:// or https://, as defined in IETF RFC 3986.

b) Make a phone call:

The book attribute should be written as "tel: " followed by a telephone number.

c) Write a mail to the specified address:

The book attribute should be written as "mailto: " followed by a single email address.

book\_type:

Used to differentiate the types of content stored in the book attribute. Shall be omitted if the book is omitted too, shall not be omitted when the book is not omitted.

a) When the book attribute points to a website.

The attribute shall contain: "text/html"

b) When the book attribute points to a telephone number.

The attribute shall contain: "application/x-tel"

c) When the book attribute points to a mail address.

The attribute shall contain: "application/x-mail"

page\_id:

Defines the target flow data of the jump, when the jump target and the jump origin are within the same document, and shall not be omitted in that case. Written as a Page\_ID. If the book attribute is set to a) website, b) telephone, or c) mail address, then this attribute is ignored.

center:

Sets a more precise destination to the jump. Can only be used when the jump target is a text/dictionary data object (see A.4.6.2 and A.4.6.3). In that case, the position within that text is specified using the char\_id of the target. May be omitted. When omitted, the jump target is the beginning of the flow data set by the page\_id attribute. If the book attribute is set to a) website, b) telephone, or c) mail address, then this attribute is ignored.

# Example:

```
<action_page_jump page_id="PG23k4" />
<action_page_jump page_id="PG23k4" center="CR0001"/>
<action_page_jump book="http://www.sharp.co.jp/" book_type="text/html"/>
```

### A.4.5 Parts data module <parts\_module>

# A.4.5.1 Storage and management

Subclause A.4.5.1 is used to store and manage information about the parts that are used to constitute the flow data. The <object\_table> element sets an object ID number and various attributes for all the objects that will be used as content, such as text objects.

The syntax of the <parts\_module> element is given in Relax NG compact format below and explained in the following text.

```
parts_module =
  element parts_module { attlist_parts_module, object_table }
attlist_parts_module &= empty
```

# [Child elements]

<object\_table> Object management module. All objects that are used in the book are registered here. Each object is recorded using one of the elements described in the following subclauses. Shall not be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

```
object_table =
  element object_table {
    attlist_object_table,
    (dynamic_text_object_entry
    | sound_object_entry
    | search_page_object_entry
    | movie_object_entry
    | dict_data_object_entry)+
  }
attlist_object_table &= empty
```

## [Child elements]

The details of these elements are given in A.4.5.2 to A.4.5.6.

### Example:

# A.4.5.2 Dynamic text object <dynamic\_text\_object\_entry>

Records text objects to be used as part of the flowing content. This element has the following child element and attributes. Its syntax is given in Relax NG compact format below and explained in the following text.

```
dynamic_text_object_entry =
  element dynamic_text_object_entry {
    attlist_dynamic_text_object_entry, permission_info?
  }
attlist_dynamic_text_object_entry &=
```

```
attribute src { text },
attribute type { text },
attribute object_id { text }
```

src: Filename of the text object instance. Shall not be omitted. Before opening

the file specified in this attribute, it shall be checked against the type

attribute.

type: Stores the MIME type of the text object instance. The only possible value is

"text/x-bvf-text". Shall not be omitted.

object\_id: Assigns an ID number to the object. This number is used from the flow data

or event data modules to refer to this object. Written in the standard

object ID format. Shall not be omitted.

## [Child elements]

<permission\_info> Defines the permissions concerning the object pointed to by the src

attribute. Written in the standard Permission format. May be omitted. The details are given in A.3.23.

# Example:

# A.4.5.3 Sound object <sound\_object\_entry>

The <sound\_object\_entry> records sound objects. Its syntax is given in Relax NG compact format below and explained in the following text.

```
sound_object_entry =
  element sound_object_entry {
    attlist_sound_object_entry, sound_object_info
  }
attlist_sound_object_entry &=
  attribute src { text },
  attribute type { text }
```

type: Records the MIME type of the sound object. In the current standard, the

following types are permitted. Shall not be omitted.

MP3: "audio/mp3"
AAC: "audio/3gpp2"

SMAF: "application/x-smaf"

src: Filename of the sound object, written in the standard Filename format. Shall

not be omitted. Before opening the file specified in this attribute, it shall be checked against the type attribute. Currently, only mp3 (extension: .mp3),

AAC (extension: .3g2) and SMAF (extension: .mmf) are allowed.

# [Child elements]

<sound\_object\_info> Records information concerning the sound object. The following attribute is available. Its syntax is given in Relax NG compact format below

and explained in the following text.

```
sound_object_info =
  element sound_object_info { attlist_sound_object_info, empty }
attlist_sound_object_info &= attribute object_id { text }
```

[Attribute]

object\_id: Assigns an ID number to the object. This number is used

by the event data module to refer to this object. Written in

the standard object ID format. Shall not be omitted.

# Example:

## A.4.5.4 Search page object <search\_page\_object\_entry>

This records search page objects. Its syntax is given in Relax NG compact format below and explained in the following text.

```
search_page_object_entry =
  element search_page_object_entry {
    attlist_search_page_object_entry, permission_info?
  }
attlist_search_page_object_entry &=
```

```
attribute src { text },
attribute type { text },
attribute object_id { text }
```

src:

Filename of the search page object, written in the standard Filename format. Shall not be omitted. Before opening the file specified in this

attribute, it shall be checked against the type attribute.

Records the MIME type of the search page object. In the current specification, only "text/x-bvf-search-page" is permitted. Shall not be type:

omitted.

Assigns an ID number to the object. This number is used by the event data object\_id:

module to refer to this object. Written in the standard object ID format.

Shall not be omitted.

### [Child elements]

<permission info> Defines the permissions concerning the object pointed to by the src attribute. Written in the standard Permission format. May be omitted. The details are given in A.3.23.

#### Example:

```
<search page object entry</pre>
       src="spage1.xml" type="text/x-bvf-search-page" object_id="OBSP01" />
<search page object entry
       src="spage2.xml" type="text/x-bvf-search-page" object_id="OBSP02" >
       <permission info>
              <print_permission permission="authorized"/>
       </permission_info>
</search_page_object_entry>
```

#### A.4.5.5 Movie object <movie\_object\_entry>

This records movie objects. Its syntax is given in Relax NG compact format below and explained in the following text.

```
movie_object_entry =
 element movie object entry { attlist movie object entry, empty }
attlist_movie_object_entry &=
 attribute src { text },
```

```
attribute type { text },
attribute object id { text }
```

src:

Filename of the movie object, written in the standard Filename format. Shall not be omitted. Before opening the file specified in this attribute, it shall be checked against the type attribute. Currently, only 3GPP2 (extension: .3g2) is allowed.

is allowed.

type:

Records the MIME type of the movie object. In the current standard, the

following type is permitted. Shall not be omitted.

3GPP2: "video/3gpp2"

object\_id:

Assigns an ID number to the object. This number is used by the event data module to refer to this object. Written in the standard object\_ID format.

Shall not be omitted.

#### Example:

```
<movie_object_entry src="movie1.3g2" type="video/3gpp2" object_id="OBmv00"/>
```

# A.4.5.6 Dictionary data object <dict\_data\_object\_entry>

This records text dictionary data objects. Its syntax is given in Relax NG compact format below and explained in the following text.

```
dict_data_object_entry =
  element dict_data_object_entry {
    attlist_dict_data_object_entry, permission_info?
}
attlist_dict_data_object_entry &=
  attribute src { text },
  attribute type { text },
  attribute object_id { text }
```

## [Attributes]

src:

Filename of the dictionary data object instance. Shall not be omitted. Before opening the file specified in this attribute, it shall be checked against the type attribute.

IEC 62605:2016 © IEC 2016

type: Stores the MIME type of the dictionary data object instance. The only

possible value is "text/x-bvf-dict-data". Shall not be omitted.

object\_id: Assigns an ID number to the object. This number is used from the flow data

or event data modules to refer to this object. Written in the standard

object ID format. Shall not be omitted.

#### [Child elements]

<permission\_info> Defines the permissions concerning the object pointed to by the src

attribute. Written in the standard Permission format. May be omitted. The

details are given in A.3.23.

# Example:

## A.4.6 Object instances

#### A.4.6.1 General

The term "object instance" is used in this annex to refer to the objects that are displayed (or played, as appropriate) by the viewer. Defined are the following object instances.

Text object instance

Dictionary data object instance

Image object instance

Sound object instance

Animation object instance

Search page object instance

Movie object instance

## A.4.6.2 Text object instance <text\_data>

#### A.4.6.2.1 Text object instances

The text object instances are stored in XML files of their own, with <text\_data> as the root element. The syntax of the <text\_data> element is given in Relax NG compact format below.

```
text_data =
  element text_data {
   attlist_text_data, text_default_attribute, text_body
```

```
BS EN 62605:2016
IEC 62605:2016 © IEC 2016 - 73 - 
}
attlist_text_data &= empty

Example:
```

# A.4.6.2.2 Text default attributes <text\_default\_attribute>

Text default attributes store parameters to use when displaying the text. Be aware that these parameters may not always be respected, if the viewer is not able to handle the values/behaviors set in this module, or if the viewer is configured to give precedence to user settings. In addition, as was explained in A.4.3.2.3, some of the parameters defined here may also be set in the whole text flow (in the <flow\_default\_attribute>, a child element of <flow\_entry>). These are used as default if the local ones (the ones we define here) are not set. In case both are defined, the local settings take precedence.

The syntax of the <text\_default\_attribute> element is given in Relax NG compact format below and explained in the following text.

```
text_default_attribute =
  element text_default_attribute {
   attlist_text_default_attribute,
   text_default_font?,
   text_default_background?,
   text_default_background_music?,
   line_breaking_method?
  }
attlist_text_default_attribute &=
  attribute baseline { BaseLine }?,
  attribute valign { "middle" }?
```

baseline:

Defines the orientation of the baseline (and therefore of the text) for each flow. The possible values are listed below. Defaults to the <flow default attribute> value if omitted.

"right": The writing direction is horizontal (left to right). However,

the direction can be changed at the user's option.

"right\_only": The writing direction is horizontal (left to right), and the

user cannot change the setting. However, if it is not supported by the viewer, this setting is not necessarily

applied.

"down": The writing direction is vertical (top to bottom). However,

the direction can be changed at the user's option.

"down\_only": The writing direction is vertical (top to bottom), and the

user cannot change the setting. However, if it is not supported by the viewer, this setting is not necessarily

applied.

valign:

Determines how the text box is to be positioned. The vertical position for horizontally written text, or the horizontal position for vertically written text is what is determined here. The value described below is eligible. When omitted, the text box should be displayed from the top of the display area.

"middle": The content of the <text\_body> element is centered within

the display area, as shown below. If the content is larger than the display area, this attribute is ignored, see

Figure A.2.

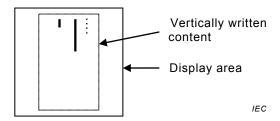

Figure A.2 - Example of valign="middle"

# [Child elements]

<text\_default\_font> Defines the default font and font color for this text object. When omitted, defaults to the <flow\_default\_attribute> value. Its syntax is given in Relax NG compact format below and explained in the following text.

```
text_default_font =
  element text_default_font { attlist_text_default_font, empty }
attlist_text_default_font &=
  attribute fontname { text }?,
  attribute color_space { "RGB" }?,
  attribute opacity { "100" }?,
  attribute color { text }?,
  attribute ruby_flag { "yes" | "yes_only" | "no" | "no_only" }?
```

fontname:

Default font name. More than one font may be specified. In that case, each font name should be separated by a comma (U+002C). For instance:

fontname="Aaa sans serif, Bbb gothic"

The viewer should use the first listed font that is available. When omitted, defaults to the <flow\_default\_attribute> value.

color\_space, color, opacity:

Defines the font color to be used for the content data. Written in the standard color data type. When omitted, defaults to the <flow default attribute> value.

ruby\_flag:

Defines whether ruby in the content data is to be viewed or not. When omitted, defaults to the <flow\_default\_attribute> value. The text to be displayed when ruby is turned on is the one included in the <ruby> element of text object instances. The following values may be used.

"yes": Ruby should be displayed, but can be

turned off by the user.

"yes\_only": Ruby shall be displayed, and cannot be

turned off by the user. However, this does not apply to viewers not able to

display ruby.

"no": It is recommended that ruby not be

displayed, but can still be turned on

according to user preferences.

"no\_only": Ruby shall not be displayed, and cannot

be turned off by the user. However, this does not apply if the viewer is incapable

of disabling ruby display.

<text\_default\_ background> Defines the background color and background image to be used for this text object. When both are defined, the image is drawn centered in the screen filled with the background color. Finally, the content of the <text\_body> element is rendered on the top. If the background image is too large to fit inside the screen, it is scaled down with the aspect ratio being preserved. The behavior in case of omission of this element should conform to the behavior specified in case of omission of its attributes. Its syntax is given in Relax NG compact format below and explained in the following text.

```
text_default_background =
  element text_default_background {
    attlist_text_default_background, permission_info?
  }
attlist_text_default_background &=
  attribute color_space { "RGB" }?,
  attribute opacity { "100" }?,
  attribute color { text }?,
  attribute src { text }?
```

color\_space, color, opacity:

Defines the color to be used as background color. Written in the standard color data type. When omitted, defaults to

the <flow default attribute> value.

Stores the MIME type of the background image. May be type:

omitted only if the src attribute is also omitted. The

possible values are listed below.

"image/png"

"image/jpeg"

Sets the filename of the image to use as a background src:

image, written in the standard Filename format. May be omitted. Before opening the file specified in this attribute,

it shall be checked against the type attribute.

## [Child elements]

#### <permission\_info>:

Defines the permissions about the image referred to by the src attribute. Written in the standard Permission format. May be omitted. If the src attribute is omitted, this permission information should be ignored. The details are given in A.3.23.

# <text\_default\_background\_music>

Defines the background music to be played while displaying this text object. If this element is omitted, nothing should be played. Its syntax is given in Relax NG compact format below and explained in the following text.

```
text_default_background_music =
 element text_default_background_music {
  attlist_text_default_background_music, permission_info?
attlist text default background music &=
 attribute type { text },
 attribute src { text },
 [ a:defaultValue = "no" ] attribute loop { Yes_No }?
```

### [Attributes]

Stores the MIME type of the background music. Shall not

be omitted. The possible values are listed below.

"audio/mp3" "audio/3gpp2"

"application/x-smaf"

Sets the filename of the background music, written in the

standard Filename format. Shall not be omitted. Before

type:

src:

opening the file specified in this attribute, it shall be checked against the type attribute.

loop:

Specifies whether the background music should be played iteratively (i.e. repeated from the beginning every time the end is reached). Possible values are "yes" and "no". In case of omission, no is assumed.

## [Child elements]

<permission info>:

Defines the permissions about the sound file referred to by the src attribute. Written in the standard Permission format. May be omitted.

line\_breaking\_method> Specifies the algorithm to be used to determine how text should be split in lines. Various languages handle this in various ways, so this element allows for some flexibility. When omitted, defaults to the <flow\_default\_attribute> value. The syntax of line\_breaking\_method> is given in Relax NG compact format below and explained in the following text.

line\_breaking\_method =
 element line\_breaking\_method { attlist\_line\_breaking\_method, empty }
attlist\_line\_breaking\_method &=
 [ a:defaultValue = "none" ] attribute method { "none" }?

#### [Attributes]

method:

Chooses the line breaking method. Defaults to "none".

Possible values are:

"none":

no special processing, when a line is filled with characters, go to the next one.

Other values are possible for localization. See Clause A.6 for details.

Other attributes may be added by localized methods. See Clause A.6 for details.

# [Child elements]

None, unless added by localized methods. See Clause A.6 for details.

#### Example:

```
<text_default_attribute>
    <text_default_font fontname="foobar-serif" color="green"/>
    <text_default_background color="black" src="001.jpg" type="image/jpeg"/>
    <text_default_background_music src="1.mp3" type="application/x-smaf"
loop="yes"/>
    line_breaking_method ="none">
    </line_breaking_method >
</text_default_attribute>
```

## A.4.6.2.3 Text body <text\_body>

#### A.4.6.2.3.1 General

This part records the actual text body of the text object. In this element, Extended character string, as well as the elements described below may be used. Its syntax is given in Relax NG compact format below and explained in the following text.

```
text_body = element text_body { attlist_text_body, All_tag* }
attlist_text_body &= empty
```

## A.4.6.2.3.2 Paragraph

...

Creates a paragraph. Generally, there is a line break at the beginning of the paragraph (right before the element), and at its end (right after the element). However, there is no line break in the cases listed below.

If the paragraph starts at the beginning of a line even without inserting a line break.

If what follows the paragraph starts at the beginning of a line even without inserting a line break.

It should also be noted that should the paragraph end occur in text flowing around a image (see the align attribute of the <object> element), the line break does not cancel this effect. Therefore, the next line still flows around the image. In order to cancel the flowing, and start the new line after the image, <br/>br clear="all"/> shall be explicitly used. The syntax of the element is given in Relax NG compact format below and explained in the following text.

```
p = element p { attlist_p, All_tag_p* }
attlist_p &=
  attribute top_line_indent { text }?,
  attribute top { text }?,
  attribute bottom { text }?,
  attribute align { "center" | "right" | "left" }?,
  attribute drop_cap { text }?
```

top\_line\_indent: Sets the size (expressed in em) of the indentation of the first line of the paragraph. The spaces are inserted before the first character following the element, and the first character following a <br/>br/> element in the paragraph. The unit is "em". The actual spacing is the sum of the value set in this attribute and the margin of the paragraph set by the "top" attribute. Moreover, this attribute may be set to a negative value, like "-2em". When omitted, defaults to 0.

top:

Defines the size of the left margin of the paragraph (top margin in case the writing direction is vertical). It is expressed either in em or in a percentage of the line length (column in case the writing direction is vertical). When omitted, defaults to "0em". Negative values shall not be used. Paragraphs may be contained in another paragraph. In that case, the margins are added. Percentages are also relative to the inner area thus calculated, not the total display area.

bottom:

Defines the size of the right margin of the paragraph (bottom margin in case the writing direction is vertical). It is expressed either in em or in a percentage of the total line size (column in case the writing direction is vertical). When omitted, defaults to "0em". Negative values shall not be used. Paragraphs may be contained in another paragraph. In that case, the margins are added. Percentages are also relative to the inner area thus calculated, not the total display area.

align:

Determines whether the text should be in the center, leftaligned or right-aligned within the line size defined by the top, bottom and first line indent attributes. This attribute accepts the values listed below. When omitted, the current setting is kept unchanged.

"center": The string included in the element is

displayed in the center.

"right": The string included in the element is

right-aligned, or bottom-aligned in the

case of vertical writing.

"left": The string included in the element is

left-aligned, or top-aligned in the case of

vertical writing.

drop cap:

Allows to turn the first letter of the paragraph into a dropped capital. The value is an integer representing the number of lines that the dropped capital should cover. Defaults to "1" (Normal size), see Figure A.3.

Alice was beginning to get
very tired of sitting by her sister on the bank,
and of having nothing to do...

A lice was beginning to get very tired of sitting by her sister on the bank, and of having nothing to do...

IEC

Figure A.3 - Example of dropped capital

#### [Child elements]

Except the <page\_break/> and <head> elements, any element that may be inside <text\_body>, as well as Extended character strings may be used as the content of the element.

Figure A.4 shows an example of a horizontally written paragraph with top="25 %" and bottom="2em".

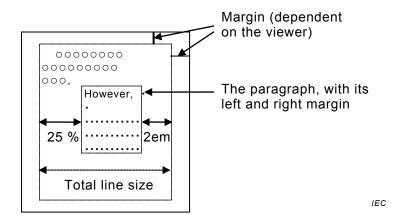

Figure A.4 – Left and right margin of a paragraph

#### Example:

```
 ...  ...
```

<scrolling\_text> Defines a line of scrolling text. Line breaks are automatically inserted around this element (right before the <scrolling\_text> element and right after the </scrolling\_text> element), to guarantee that the scrolling text is alone on its line. The height of the scrolling text object depends entirely on its content. In the case of horizontally written text, scrolling is done right to left, while for vertical text it should move the text from the bottom, upwards. The text should be scrolled until it disappears from the display area (limited by the "top" and "bottom" margin of the surrounding paragraph if there is one), and then start again. The syntax of the <scrolling\_text> element is

given in Relax NG compact format below and explained in the following text.

### [Child elements]

The string to be displayed as scrolling text is written as a child element, in the form of an Extended character string. The following elements may also be used: <external\_char>, <font>, <horizontal>, <ruby>, <sub>, <sup> and <object>. However, the <object> element has the following additional limitations when used as a child element of the <scrolling\_text> element:

only image files may be designated by the src attribute;

the align attribute may only be set to "top", "middle", or "bottom"; the char\_id attribute shall not be used.

## Example:

#### A.4.6.2.3.3 Inline elements

<br/>br/>

Inserts a line break. Its syntax is given in Relax NG compact format below and explained in the following text.

```
br = element br { attlist_br, empty }
attlist_br &= attribute clear { "left" | "right" | "all" }?
```

[Attribute]

clear:

Cancels the text's flowing around an embedded object, such as an image. The <br/>br/> element does not do so when this attribute is omitted. The following values are possible.

"left":

Inserts blank lines after the <br/>element until the text can be inserted at the beginning of the line (left for horizontal writing, top for vertical). In other words, it moves the insertion point

after the object, if any, around which the text flows, if it is on the left.

"right":

Inserts blank lines after the <br/>element until the text can be inserted until the end of the line (right for horizontal writing, bottom for vertical). In other words, it moves the insertion point after the object, if any, around which the text flows, if it is on the right.

"all":

Inserts blank lines after the <br/>element until the text can be inserted from the beginning to the end of the line. In other words, it moves the insertion point after the object, if any, around which the text flows, regardless of its being on the left or right.

#### Example:

<br/><br/><br clear="all"/>

<hr/>

Draws a horizontal line (a vertical one when the text is written vertically). As this line shall always be alone in its row (column when the text is vertical), a line break (equivalent to <br/>br/>) is always inserted after it, and before it also, unless the line starts from the top on its own. Its syntax is given in Relax NG compact format below and explained in the following text.

```
hr = element hr { attlist_hr, empty }
attlist_hr &=
  attribute size { text }?,
  attribute length { text }?,
  attribute align { "left" | "center" | "right" }?
```

#### [Attributes]

size: Determines the line's thickness. Expressed in "em". Note

that this value does not need to be an integer. When

omitted, it defaults to "0.1em".

length: Determines the line's length. Expressed in "em" or as a

percentage of the available space (row if the text is written horizontally, column if written vertically), taking into account the enclosing element's "top" and "bottom"

attributes. When omitted, it defaults to "100 %".

align: Sets the position of the line if it is drawn shorter (using the

length attribute) than the available area. Possible values are "left", "center" and "right". Defaults to center when

omitted.

## Example:

```
<hr/><hr size="0.5em" length="50%" align="center"/>
```

<font>...</font> Defines font properties for the text enclosed in the element. Its syntax
is given in Relax NG compact format below and explained in the following
text.

```
font = element font { attlist_font, Inline* }
attlist font &=
 attribute name { text }?,
 attribute size { text }?,
 attribute base { "default" | "last" }?,
 attribute color_space { "RGB" }?,
 attribute opacity { "100" }?,
 attribute color { text }?,
 attribute bold { Yes_No }?,
 attribute underline { Yes_No }?,
 attribute italic { Yes_No }?,
 attribute oblique { Yes_No }?,
 attribute small_caps { Yes_No }?,
 attribute family {
   "monospace" | "san-serif" | "serif" | "cursive" | "fantasy"
 }?,
 attribute ul_type { "rightscore" | "leftscore" | "throughscore" }?,
 attribute em_type {
   "rightscore"
   | "leftscore"
   | "throughscore"
   | "kendot"
   | "bold"
   | "italic"
   | "bold_italic"
   | "reverse"
   | "shade"
 }?
```

[Attributes]

name:

Defines the font to use, by specifying the font name. If omitted, the font used before the <font> element will continue to apply. More than one font name may be specified. In that case, each font name should be separated by a comma (U+002C). For instance:

fontname="Aaa sans serif,Bbb gothic"

The viewer should use the first listed font that is available.

size: Sets a different font size. The size is set as a percentage

of what is set by the base attribute. If omitted, the base

size is not modified.

base: Defines the base of calculation for the size attribute. The

values listed below are accepted. If omitted, it defaults to

"last".

"last": Same size as the character before the

<font> element.

"default": Same size as the default font size.

color\_space, color, opacity: Changes the character's color. Written in

the standard Color data type (see.A.3.16 for details). If omitted, the color used for the characters immediately

before the <font> element are used.

bold: Defines whether the string included in the <font> element

should be displayed in bold face or not. The acceptable

values are:

"yes": display in bold "no": display normally

When omitted, the current state is kept.

underline: Defines whether the string included in the <font> element

should be underlined or not.

"yes": display with underline

"no": display normally

Objects (e.g. image objects) included inside the <font> element should not be underlined even if this attribute is

set to "yes". When omitted, the current state is kept.

italic: Decides if the content data should be displayed in italic or

not. If omitted, the behavior depends on the viewer. The

acceptable values are:

"yes": display in italic
"no": display normally

When omitted, the current state is kept.

oblique: Decides if the content data should be displayed in oblique

or not. If omitted, the behavior depends on the viewer. The

acceptable values are:

"yes": display in oblique

"no": display normally

When omitted, the current state is kept.

small\_caps: Decides if the content data should be displayed in small

capitals or not. If omitted, the behavior depends on the

viewer. The acceptable values are:

"yes": display in small capitals

"no": display normally

When omitted, the current state is kept.

family: Specifies the font family to be used. The font actually used

in rendering depends on the viewer. If omitted, the behavior is also viewer-dependent. The acceptable values

are:

"monospace": display in fixed-width fonts

"sans-serif": display in fonts without serifs
"serif": display in fonts with serifs

"cursive": display in handwriting-style fonts

"fantasy": display in decorative fonts

When omitted, the current state is kept.

ul\_type

Specifies how strings in <u> element and its equivalent are rendered. The acceptable values are as follows, all of which are taken from ISO/IEC 9541-1:2012 (8.7.1.12.1.1 Score Name). Refer to ISO/IEC 9541-1:2012 for the exact meaning of these values.

"rightscore"

"leftscore"

"throughscore"

em\_type:

Specifies how strings in <em> element and its equivalent are rendered. The acceptable values are as follows, the first 4 of which are taken from ISO/IEC 9541-1:2012 (8.7.1.12.1.1 Score Name). Refer to ISO/IEC 9541-1:2012 for the exact meaning of these values.

Note that when this attribute is specified, <em> element is no longer equivalent to <font bold="yes" italic="yes">

"rightscore"

"leftscore"

"throughscore"

"kendot"

bold: The substrings should be rendered in bold font.

italic: The substrings should be rendered in italic font.

bold\_italic: The substrings should be rendered in bold

italic font.

"reverse": The substring should be rendered with the

characters and background reversed.

"shade": The substrings should be rendered with shade.

### [Child elements]

Any combination of Extended character strings and all the inline elements (except <page break/>) and <object> may be used.

## Example:

```
<font name="Aaa sans serif">.....</font>
<font size="200%">.....</font>
```

<i>...</i> Specifies that the substrings should be displayed in italic. Equivalent to <font italic="yes">...</font>

```
i = element i { attlist_i, Inline* }
attlist_i &= empty
```

<u>...</u> Specifies that the substrings should be underlined. Equivalent to <font underline="yes">...</font>. It has the following attribute.

```
u = element u { attlist_u, Inline* }
attlist_u &= attribute ul_type { "rightscore" | "leftscore" | "throughscore" }?
```

ul\_type

Specifies how strings in <u> element and its equivalent should be rendered. The acceptable values are as follows, all of which are taken from ISO/IEC 9541-1:2012 (8.7.1.12.1.1 Score Name). Refer to ISO/IEC 9541-1:2012 for the exact meaning of these values.

"rightscore"
"leftscore"
"throughscore"

<em>...</em> Specifies that the substrings should be displayed in bold italic. Equivalent to <font bold="yes" italic="yes">... </font> in default settings. Its syntax is given in Relax NG compact format below and explained in the following text.

```
em = element em { attlist_em, Inline* }
attlist_em &=
   attribute em_type {
    "rightscore"
    | "leftscore"
    | "throughscore"
    | "kendot"
    | "bold"
    | "italic"
    | "bold_italic"
    | "reverse"
    | "shade"
}?
```

If em\_type attribute in <flow\_default\_font> and <text\_default\_font>.is specified, this is not the case and how the strings in this element should be rendered depends on the em\_type attribute.

em\_type:

Specifies how strings in <em> element and its equivalent are rendered. May be omitted. When specified, this overrides what was specified by the em\_type attribute of <flow\_default\_font>. The acceptable values are as follows, the first 4 of which are taken from ISO/IEC 9541-1:2012 (8.7.1.12.1.1 Score Name). Refer to ISO/IEC 9541-1:2012 for the exact meaning of these values.

"rightscore"
"leftscore"
"throughscore"
"kendot"

"bold": The substrings should be rendered in bold font.

"italic": The substrings should be rendered in italic font.

"bold\_italic": The substrings should be rendered in bold italic font.

"reverse": The substring should be rendered with the characters and background reversed.

"shade": The substrings should be rendered with shade.

<oblq>...</oblq> Specifies the substring should be displayed in oblique. Equivalent to <font oblique="yes">...</font>. Its syntax is given in Relax NG compact format below.

oblq = element oblq { attlist\_oblq, Inline\* }
attlist\_oblq &= empty

sc = element sc { attlist\_sc, Inline\* }
attlist\_sc &= empty

<mlg>...</mlg> Represents a multiline note. Although this annex does not specify how multiline notes should be rendered, an example of how they are to be rendered is shown below for a better understanding of the concept.

Example:

# これが割注<mlg>わりちゅう</mlg>です。

これが割注 ゥゥゥ です。

これが割注(わりちゅう)です。

The syntax of the <mlg> element is given in Relax NG compact format below.

mlg = element mlg { attlist\_mlg, Inline\* }
attlist\_mlg &= empty

<horizontal>...</horizontal> Defines substrings that should be displayed horizontally even when the general text direction is vertical. This is often used for dates and other numbers in Japanese texts, see Figure A.5. When the text is written horizontally, this element has no effect. Its syntax is given in Relax NG compact format below and explained in the following text.

horizontal = element horizontal { attlist\_horizontal, TextWithGaiji }

attlist\_horizontal &= empty

#### [Child elements]

External extended character strings may be used here.

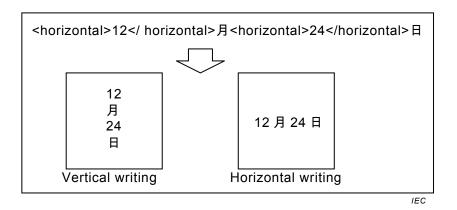

Figure A.5 - Horizontal writing in vertical text

<ruby>...</ruby> Used to display ruby text. Ruby is an often used feature in Asian, and particularly Japanese typography. It consists in a short run of text displayed above the base text, mostly used as a pronunciation guide for ideographic characters. As far as the available fonts permit it, ruby text is usually displayed in smaller characters than the base text it annotates. See Figure A.6 for an example. How line spacing is handled to open enough space to display ruby depends on the viewer. It should also be noted that as ruby is fundamentally a reading aid, and some people may not want or need it, some viewers may have an option to disable ruby display altogether. The syntax of the <ruby> element is given in Relax NG compact format below and explained in the following text.

```
ruby = element ruby { attlist_ruby, rbase, rtop }
attlist_ruby &= empty
```

# [Child elements]

<rb>

The base string which should be annotated by a ruby. Shall not be omitted. Consists of an External extended character string. Its syntax is given in Relax NG compact format below.

```
rb = element rb { attlist_rb, TextWithGaiji }
attlist rb &= empty
```

<rt>

The ruby string that will be displayed above the base (or on the right side, if displaying vertical text). Shall not be omitted. Consists of an External extended character string. Its syntax is given in Relax NG compact format below.

```
rt = element rt { attlist_rt, TextWithGaiji }
attlist_rt &= empty
```

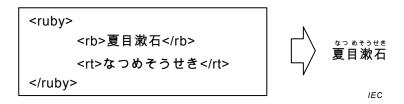

Figure A.6 - Ruby

<sub>...</sub> Represents the substring as subscripts. Its syntax is given in Relax NG compact format below.

```
sub = element sub { attlist_sub, TextWithGaiji }
attlist sub &= empty
```

<sup>...</sup> Represents the substring as superscripts. Its syntax is given in Relax NG compact format below.

```
sup = element sup { attlist_sup, TextWithGaiji }
attlist_sup &= empty
```

<external\_char> Inserts an External character. The syntax is described in detail in A.3.11. Within the text object instance, the alt\_img and alt\_vimg attributes may be used.

Example:

```
<external_char alt_set="oooextchars" alt_code="0x1234" alt_img="ou.img" alt_vimg="ou_v.img" img_type="image/jpeg" alt="鴎"/>
```

<mask>

Adds a masking capability to the string embedded in this element. When this string or one designated by the trigger attribute is clicked, the child element string is covered and uncovered alternately. Its syntax is given in Relax NG compact format below and explained in the following text.

```
attlist_mask &=

[ a:defaultValue = "on" ] attribute initial_flag { "on" | "off" }?,

attribute trigger { text }?,

attribute char_id { text }?,

[ a:defaultValue = "default" ]

attribute mask_type { "default" | "color" }?,

attribute color_space { "RGB" }?,

attribute opacity { "100" }?,

[ a:defaultValue = "black" ] attribute color { text }?,

[ a:defaultValue = "scope" ] attribute hold_flag { HoldFlag }?
```

initial flag:

Determines the initial state of the mask. The possible values are listed below, with "on" being the default in case of omission.

"on": The content is hidden by the mask.

"off": The content is not hidden.

trigger:

Designates the string(s) that trigger the mask's status change. When a string indicated by this attribute is clicked, the mask should toggle between on and off. Written as one or more Char\_IDs with comma signs (U+002C) separating them in the latter case, as seen in the following.

Example:

### "CR0001,CR0002,CR0003"

The designated character string shall be in the same text object instance. Note that the char id used here shall not be specified at the same time as a trigger in the event info module. If it is specified, no action is triggered on the mask even if the designated string is clicked. When omitted, the string enclosed in the mask itself serves as a trigger.

char\_id: Sets a string ID to this <mask> object. Written in the

standard Char\_ID format. May be omitted.

mask\_type: Selects the type/style of mask to be used. The values

listed below may be used. Defaults to "default" when

omitted.

"default": The apperance of the mask depends on

the viewer.

"color": The mask is a filled, colored box. The

color is either defined by the corresponding attributes, or their default

value in case of omission.

color\_space, color, opacity: Defines the color of the mask, using the

standard Color data type, as described in A.3.16. Shall be defined only if the mask\_type attribute is set to "color". If

omitted, defaults to "black".

hold\_flag: Defines the state recording policy, allowing to remember

whether the mask has been turned on or off. May be set to the values listed below. Defaults to "scope" when omitted.

"scope": Remembers the state as long as the

current text object instance is displayed.

"on\_power": Remembers the state as long as the

document is open.

"save": The state should be saved when closing

the document and restored next time it is

opened.

## [Child elements]

elements. However, the following restrictions apply to the <object> element:

The src attribute shall point to an image file.

The char\_id attribute shall not be used.

## Example:

```
The answer is <mask>42 </mask>.
The answer is <mask trigger ="CR0002">42</mask>.
```

<char\_id> </char\_id> Attaches a string ID number to its content. Its syntax is given in
Relax NG compact format below and explained in the following text.

```
char_id = element char_id { attlist_char_id, Inline* }
attlist_char_id &= attribute char_id { text }
```

## [Attribute]

char id:

Sets the ID number of the element's content, written in the Char ID standard format. Shall not be omitted.

[Child elements]

The content of this element may be any combination of Extended character strings, inline elements except <page break>, and the <object> element.

<head> </head> Defines a list of keywords to be used for searching capabilities. The following child elements are available. It is possible to write the string right after the </head> element. The interpretation for such a description is left to the viewer and the conversion (if any). Its syntax is given in Relax NG compact format below and explained in the following text.

```
head = element head { attlist_head, headword+, key* }
attlist_head &= empty
```

# [Child elements]

<headword>

Records a single keyword. There shall be at least one <headword> per <head>. The <headword> element can also be used for regisitering the word for inclusion in a search table by specifying table\_id attribute. Its syntax is given in Relax NG compact format below and explained in the following text.

```
headword = element headword { attlist_headword, TextWithGaiji }
attlist_headword &=
attribute type { text }?,
attribute table_id { text },
[ a:defaultValue = "IPA" ] attribute phonetic_notation { text }?
```

type:

specifies the type of the word in a Standard character string. The following values are pre-defined while other userdefined values are allowed as well. However, it is strongly recommended that "pronunciation" be used when applicable (i.e. the string represents phonetic symbols).

"pronunciation":

The string represents pronunciation symbols.

other values:

Other user-defined values are possible.

table\_id:

Points to the search table to which this keyword is to be added, by using the table's ID number, which is defined in <seach\_table\_def> (see A.4.3.2.6). Shall not be omitted if the content has a search page object (see A.4.6.7). Not to be confused with Reference ID (see

A.4.6.3.4).

phonetic\_notation:

Denotes the phonetic alphabet used. Defaults to "IPA". To be ignored when the type is not "pronunciation". The following values are pre-defined while other user-defined values are allowed as well However, strongly it is recommended that "IPA" be used when reasonably applicable.

"IPA": Denotes "International Phonetic

Alphabet",

### [Child elements]

Inside the element is stored the text that should be displayed in the search results when the keyword matches. It is simply an External extended character string.

<key> </key> Defines the actual keyword. Only the characters allowed in the corresponding search table may be used if <search\_table> exists. See <enable\_key\_type> for details in A.4.3.2.6. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

key = element key { attlist key, text } attlist\_key &= attribute type { text }?

#### [Attribute]

type:

Specifies the type of the keyword in Standard character string. May be omitted.

## Example:

<meaning> </meaning> Gives definitions. Its syntax is given in Relax NG compact format below and explained in the following text.

```
meaning = element meaning { attlist_meaning, All_tag_p* }
attlist_meaning &=
  attribute type { text }?,
  attribute subid { text }?,
  attribute level { text }?,
  attribute no { text }?
```

## [Attributes]

type: Specifies the category of the data. There are no

predefined categories.

subid: Specifies a Reference ID to refer to a position in the

definition.

level: Specifies the hierarchical level of the meaning in numerals

[0-9]. Recorded in the order of importance (i.e. the smaller, the nearer to the top of the hierarchy) though it is not

required that the values be consecutively used.

no: Specifies the number of the meaning in the associated

level in numerics [0-9].

<example> </example> Gives examples. Its syntax is given in Relax NG compact format below and explained in the following text.

```
example = element example { attlist_example, All_tag_p* }
attlist_example &= empty
```

When an example is given in bilingual format, it can either be represented using <span> elements with the lang attribute set to corresponding languages, or as a plain text with a delimiter implicitly predefined as appropriate. (See example below.)

## Example:

```
<example>
<span xml:lang="en">l'll take eel.</span>
<span xml:lang="ja">僕はうなぎだ。</span></example>
<example>l'll take eel|僕はうなぎだ。</example>
```

<subhead> </subhead> Defines sub-headwords and related data. Intended to be used for introducing derived and compound words, etc. Its syntax is given in Relax NG compact format below and explained in the following text.

```
subhead =
 element subhead {
  attlist subhead, subheadword+, meaning*, example*, key*
 }
attlist subhead &=
 attribute type { text }?,
 attribute subid { text }?
              [Attributes]
                subid: Defines a Reference ID for this entry. May be omitted.
                type: Defines type for the subhead word (e.g. derived word, compound
                                word) in a Standard character string. May be omitted.
              [Child elements]
                 <subheadword> </subheadword>
                                                        Defines
                                                                   sub-headwords.
                                                                                       Its
                                syntax is given in Relax NG compact format below and
                                explained in the following text.
                                                 subheadword
                                                                     attlist subheadword,
                subheadword
                                     element
                                TextWithGaiji }
                attlist_subheadword &=
                  attribute type { text }?,
                  attribute subid { text }?
```

#### [Attributes]

subid: Defines a Reference ID for the subhead

word. May be omitted.

type: Defines type for the subhead word (e.g.

derived word, compound word) in a standard character string. The following values are pre-defined while other user-defined values are allowed as well. However, it is strongly recommended that "pronunciation" be used when applicable.

May be omitted.

"pronunciation": The string represents pronunciation symbols.

#### [Child elements]

Inside the element is stored the text that should be displayed in the search results when the keyword matches. It is simply an External extended character string.

<key> </key> See the explanation of the <key> element above for details.

<meaning> See the explanation of the <meaning> element above for details.

<example> Gives definitions. See the explanation of the <example> element above for details.

<ref> </ref> Provides reference to the other items. Its syntax is given in Relax NG compact format below and explained in the following text.

```
ref = element ref { attlist_ref, All_tag_p* }
attlist_ref &=
  attribute type { text }?,
  attribute refid { text }
```

#### [Attributes]

refid: Specifies the id or subid attribute value of the referenced element.

Cannot be omitted.

type: Specifes the type of reference.

[Child elements]

The same as .

<split> </split> Specifies the delimiter between lexicographical blocks (e.g. this element may be used between the last word starting with "A" and the first word starting with "B"). This element is intended to record the starting points of such blocks as well as what strings should be rendered for that (e.g. "-B-" for a block consisting of words starting with "B"). Its syntax is given in Relax NG compact format below and explained in the following text.

```
split = element split { attlist_split, All_tag_p* }
attlist_split &= attribute level { text }?
```

## [Attribute]

level: Defines hierarchical levels in numerals [0-9]. Recorded in the order of hierarchy (i.e. the smaller, the nearer to the top of the hierarchy) though it is not required that the values be consecutively used.)

[Child elements]

The same as .

## Example

<column> </column> Introduces articles. Its syntax is given in Relax NG compact format below and explained in the following text.

```
column = element column { attlist_column, All_tag_p* }
attlist_column &=
  attribute type { text }?,
  attribute subid { text }
```

#### [Attributes]

subid: Defines a Reference ID for the column.

type: Defines the type of the column in a Standard character

string.

[Child elements]

The same as .

```
page_break = element page_break { attlist_page_break, empty }
attlist_page_break &= attribute turning_page_control { Turn_Page_Val }?
```

### [Attribute]

turning\_page\_control: Defines how ordinary scrolling interacts with the page breaks, by allowing or forbidding crossing the page break forward or backward. The possibilities are listed below.

"on": The page break shall not be crossed by

scrolling.

"off": The page break can be crossed by

scrolling.

"forward": The page break can be crossed by

scrolling only when moving forward.

"back": The page break can be crossed by scrolling only when moving backward.

When omitted, the behavior should conform to the global setting defined for the text object instance (the turning\_page\_control attribute of <flow\_data>, see A.4.3.2.4).

## Example:

```
<page_break/>
<page_break turning_page_control="off"/>
```

## A.4.6.2.3.4 Object

<object>...</object> Inserts an external object in the text body. Its syntax is given in
Relax NG compact format below and explained in the following text.

```
object = element object { attlist_object, permission_info? }
attlist_object &=
  attribute type { text },
  attribute src { text },
  attribute char_id { text }?,
  attribute align { "top" | "middle" | "bottom" | "left" | "right" }?,
  attribute start { "auto" | "event" }?,
  attribute loop { "1" }?
```

#### [Attributes]

type: Specifies the type of the inserted object, by giving the

MIME type of the file. Shall not be omitted. In this edition

of IEC 62605, the following types are permitted:

Png image: "image/png"

Jpeg image: "image/jpeg"

Mp3 audio data: "audio/mp3"

Animation object: "application/x-bvf-flip-animation"

(see A.4.6.6)

src: Sets the filename of the object to be inserted, written in

the standard Filename format. Shall not be omitted. It shall be checked against the type attribute before the file

referred to by this src attribute is read.

char\_id: Assigns a string ID number to this object, written as a

Char ID. May be omitted.

align: Defines how text should flow around the inserted object.

The possible values are listed below. When omitted, it defaults to bottom for horizontally written text, and to

middle for vertically written text.

"top": Inline display. When text is written

horizontally, the topmost part of the row should be aligned with the upper edge of

the object; when written vertically, the rightmost part of the column should be aligned with the right edge of the object.

"middle":

Inline display. When text is written horizontally, the object should be vertically centered on the row's base line. When writing vertically, the object should be horizontally centered on the column's base line.

"bottom":

Inline display. When text is written horizontally, the base line of the row should be aligned with the lower edge of the object; when written vertically, the base line of the column should be aligned with the left edge of the object.

"left":

Flow around. When displaying horizontal text, the object is displayed next to the left margin, and the text is written in the space between the object and the right margin. When writing vertically, the object is displayed at the top, and text below it.

If the object is larger than the space for one row/column, there may be more than one rows/column of text beside it. The align attribute of the surrounding paragraph (the element) does not influence how the object is positioned. Even if set to something different from "left", the object is displayed along the left margin. The paragraph settings, however, still apply to the text flowing around the object. When the <object> element appears on the middle of a text row, it is displayed at the beginning of the next line.

The following example should be rendered the same way with the <object> element at any position between after the letter "A" and before the letter "M".

ABCDEFGHIJKL MNOPQ RSTUV WXYZ

"right":

Flow around. When displaying horizontal text, the object is displayed next to the right margin, and the text is written in the space between the object and the left margin. When writing vertically, the object is displayed at the bottom, and the text is above it. If the object is larger than the space for one row/column, there may be more than one row/column of text beside it.

The align attribute of the surrounding paragraph (the element) does not influence how the object is positioned. Even if set to something different from "right", the object is displayed along the right margin. The paragraph settings, however, still apply to the text flowing around the object. When the <object> element appears on the middle of a text row, it is displayed on the right of the next line.

The following example should be rendered the same way with the <object> element at any position between after the letter "A" and before the letter "M".

ABCDEFGHIJKL MNOPQ RSTUV WXYZ

start:

When the src attribute points to an animation object, this allows to define when the playback is started. Can only be used with animation objects. The possible values are listed below. When omitted, defaults to "auto". Moreover, when set to auto, the animation shall not be used by the <action\_play> (see A.4.4.4.2) element.

"auto":

Playback starts automatically, as soon as the object is displayed, running the animation from the start. If the animation is hidden and displayed again (because of scrolling), it should start again from the beginning, regardless of where it stopped.

"event":

Playback is handled according to event data (see A.4.4.2).

loop:

Sets the number of times an animation should be played. In this edition of IEC 62605, the only accepted value is "1". When omitted, the animation object is played infinitely looping, until it goes out of the display area. However, if the start attribute is not set to "auto", the value of this loop attribute is ignored, and the behavior should be as if it were set to "1".

## [Child elements]

#### Example:

# A.4.6.2.3.5 Logical block elements

<div>...</div> Represents a logical block. May be nested. Its syntax is given in Relax NG compact format below and explained in the following text.

```
\div = element div { attlist_div, All_tag_p* }
attlist_div &=
  attribute level { text }?,
  attribute title { text }?
```

## [Attributes]

level: Records the depth of the level in numerals [0-9]. May be

omitted. Recorded in the order of importance (i.e. the smaller, the nearer to the top of the hierarchy) though it is

not required that the values be consecutively used.

title: Records the title for the block. May be omitted. Intended to

record the information.

[Child elements]
The same as .

<span>...</span> An element to be used to distinguish substrings that are not to be reflected in the final rendering, such as editor's memorandum. It is to be ignored by the viewer. This is also intended to be used as delimiters in <example> elements. Its syntax is given in Relax NG compact format below and explained in the following text.

```
span = element span { attlist_span, All_tag_p* }
attlist_span &= attribute type { text }?
```

[Attributes]

type: Specifies the type of the substring. In Standard character

string. May be omitted.

[Child elements]

The same as .

#### A.4.6.2.3.6 Table elements

... Introduces html-like table. This is meant to arrange data into rows and columns on rendering, and it is not to be confused with search tables (see A.4.3.2.6). Its syntax is given in Relax NG compact format below and explained in the following text.

```
table = element table { attlist_table, tr+ }
attlist_table &= empty
```

# [Child elements]

... Defines rows in the table. needs to have at least one
instance of the > element as a child element. Its syntax
is given in Relax NG compact format below.

```
tr = element tr { attlist_tr, td+, th* }
attlist_tr &= empty
```

### [Child elements]

... Defines cells in the row. needs to have at least one instance of the element as a child element. Its syntax is given in Relax NG compact format below.

```
td = element td { attlist_td, Inline* }
attlist_td &= empty
```

... Defines a header for the table. May be omitted. Its syntax is given in Relax NG compact format below.

```
th = element th { attlist_th, Inline* }
attlist_th &= empty
```

## A.4.6.2.3.7 Display according to the environment

<select>...</select> Represents alternative strings to be displayed according to the environment. Its syntax is given in Relax NG compact format below and explained in the following text.

```
select = element select { attlist_select, select_item+ }
attlist_select &=
  attribute default { text }?,
```

#### attribute type { text }?

#### [Child elements]

<select\_item>

Defines strings for each environment. Its syntax is given in Relax NG compact format below and explained in the following text.

select\_item = element select\_item { attlist\_select\_item, All\_tag\_p\* }
attlist\_select\_item &= empty

## [Attributes]

default: Specifies that the instance of the element

gives the default environment when this attribute is set to "yes." Otherwise it is

ignored.

type: Specifies the type of the environment (e.g.

the name of the hardware for which the content is intended.) in a Standard character string. Shall not be omitted.

# A.4.6.2.3.8 TTS (text-to-speech) functionality

<tts>...</tts>

Specifies the substring to be fed into text to speech representation. Its syntax is given in Relax NG compact format below and explained in the following text.

```
tts = element tts { attlist_tts, All_tag_p* }
attlist_tts &= attribute speaker { "male" | "female" | "child" }?
```

#### [Attribute]

speaker: Specifies the type of the speaker. Accepted values are:

"male": grown-up male
"female" grown-up female

"child" child

#### A.4.6.2.3.9 Event

<a> Specifies an anchor to the link in a similar manner to the corresponding <a> element of HTML. Its syntax is given in Relax NG compact format below and explained in the following text.

```
a = element a { attlist_a, Inline* }
attlist_a &= attribute href { text }
```

#### [Attribute]

href: Specifies the location of a Web resource.

#### A.4.6.3 Dictionary data object instance

#### A.4.6.3.1 General

The dictionary data object instances are stored in XML files of their own, with the <dict\_data> element as the root element. Its syntax is given in Relax NG compact format below and explained in the following text.

```
dict_data =

element dict_data {

attlist_dict_data, dict_default_attribute, dict_body

}

attlist_dict_data &= empty

[Child elements]

<dict_default_attribute> The details are given in A.4.6.3.2.

<dict_body> The details are given in A.4.6.3.3.

[Attribute]

None.
```

As can be seen, the <dict\_data> element has two main child elements, one for storing the dictionary data's default attributes (the <dict\_default\_attribute>), and one to store the data itself (<dict\_body>).

### A.4.6.3.2 Dictionary default attributes <dict\_default\_attribute>

Dictionary default attributes store parameters to use when displaying the dictionary data. Be aware that these parameters may not always be respected, if the viewer is not able to handle the values/behaviors set in this module, or if the viewer is configured to give precedence to user settings. In addition, as was explained in A.4.3.2.3, some of the parameters defined here may also be set in the whole text flow (in the <flow\_default\_attribute> child element of <flow\_entry> see A.4.3.2.4). These are used as default if not set locally as shown below. In case both are defined, the local settings take precedence.

The syntax of the <dict\_default\_attribute> element is given in the RelaxNG compact format below and explained in the following text.

```
dict_default_attribute =
  element dict_default_attribute {
```

```
attlist_dict_default_attribute,

dict_default_font?,

dict_default_background?,

dict_default_background_music?,

line_breaking_method?

}

attlist_dict_default_attribute &=

attribute baseline { BaseLine }?,

attribute valign { "middle" }?
```

baseline:

Defines the orientation of the baseline (and therefore of the text) for each flow. The possible values are listed below. May be omitted. If neither this attribute nor the corresponding option in the <flow\_default\_attribute> (see A.4.3.2.3 for details) is set, the default value depends on the viewer.

"right": The writing direction is horizontal (left to right). However,

the direction can be changed at the user's option.

"right\_only": The writing direction is horizontal (left to right), and the

user cannot change the setting. However, if it is not supported by the viewer, this setting is not necessarily

applied.

"down": The writing direction is vertical (top to bottom). However,

the direction can be changed at the user's option.

"down\_only": The writing direction is vertical (top to bottom), and the

user cannot change the setting. However, if it is not supported by the viewer, this setting is not necessarily

applied.

valign:

Determines how the text box is to be positioned. The vertical position for horizontally written text, or the horizontal position for vertically written text is what is determined here. The value described below is eligible. When omitted, the text box should be displayed from the top of the display area.

"middle": The content of the <text\_body> element is centered within

the display area. See Figure A.2 in A.4.6.2.2. If the content is larger than the display area, this attribute is

ignored.

# [Child elements]

```
element dict_default_font { attlist_dict_default_font, empty }
attlist_dict_default_font &=
  attribute fontname { text }?,
  attribute color_space { "RGB" }?,
  attribute opacity { "100" }?,
  attribute color { text }?,
  attribute ruby_flag { "yes" | "yes_only" | "no" | "no_only" }?
```

fontname:

Default font name. More than one font may be specified. In that case, each font name should be separated by a comma (U+002C). For instance:

fontname="Aaa sans serif,Bbb gothic"

The viewer should use the first listed font that is available. When omitted, defaults to the <flow\_default\_attribute> value.

color space, color, opacity:

Defines the font color to be used for the content data. Written in the standard color data type. When omitted, defaults to the <flow default attribute> value.

ruby flag:

Defines whether ruby in the content data is to be viewed or not. When omitted, defaults to the <flow\_default\_attribute> value. The text to be displayed when ruby is turned on is the one included in the <ruby> element of dictionary data object instances. The following values may be used.

"yes": Ruby should be displayed, but can be

turned off by the user.

"yes\_only": Ruby shall be displayed, and cannot be

turned off by the user. However, this does not apply to viewers not able to

display ruby.

"no": It is recommended that ruby not be

displayed, but can still be turned on

according to user preferences.

"no\_only": Ruby shall not be displayed, and cannot

be turned off by the user. However, this does not apply if the viewer is incapable

of disabling ruby display.

<dict\_default\_ background> Defines the background color and background image to be used for this dictionary data object. When both are defined, the image is drawn centered in the screen filled with the background color. Finally, the content of the <dict\_body> element is rendered on the top. If the background image is too large to fit inside the screen, it is scaled down with the aspect ratio being preserved. The behavior in case of omission of this element should conform to the behavior specified in case of omission of its attributes. Its syntax is given in Relax NG compact format below and explained in the following text.

```
dict_default_background =
  element dict_default_background {
```

```
attlist_dict_default_background, permission_info?
}
attlist_dict_default_background &=
attribute color_space { "RGB" }?,
attribute opacity { "100" }?,
attribute color { text }?,
attribute type { text }?,
attribute src { text }?
```

color space, color, opacity:

Defines the color to be used as background color. Written in the standard color data type. When omitted, defaults to the <flow default attribute> value.

type:

Stores the MIME type of the background image. May be omitted only if the src attribute is also omitted. The possible values are listed below.

"image/png"
"image/jpeg"

src:

Sets the filename of the image to use as a background image, written in the standard Filename format. May be omitted. Before opening the file specified in this attribute, it shall be checked against the type attribute.

#### [Child elements]

## <permission\_info>:

Defines the permissions about the image referred to by the src attribute. Written in the standard Permission format. May be omitted. If the src attribute is omitted, this permission information should be ignored. The details are given in A.3.23.

# <dict\_default\_background\_music>

Defines the background music to be played while displaying this dictionary data object. If this element is omitted, nothing should be played. Its syntax is given in Relax NG compact format below and explained in the following text.

```
dict_default_background_music =
  element dict_default_background_music {
    attlist_dict_default_background_music, permission_info?
  }
attlist_dict_default_background_music &=
  attribute type { text },
  attribute src { text },
  [ a:defaultValue = "no" ] attribute loop { Yes_No }?
```

type: Stores the MIME type of the background music. Shall not

be omitted. The possible values are listed below.

"audio/mp3"

src: Sets the filename of the background music, written in the

standard Filename format. Shall not be omitted. Before opening the file specified in this attribute, it shall be

checked against the type attribute.

loop: Specifies whether the background music should be played

iteratively (i.e. repeated from the beginning every time the end is reached). Possible values are "yes" and "no". In

case of omission, no is assumed.

[Child elements]

<permission\_info>:

Defines the permissions about the sound file referred to by the src attribute. Written in the standard Permission format.

May be omitted. The details are given in A.3.23.

line\_breaking\_method> The details are given in A.4.6.2.2.

## A.4.6.3.3 Main part of the dictionary data <dict\_body>

The <dict\_body> element stores the main part of the dictionary data. Its syntax is given in Relax NG compact format below and explained in the following text.

# A.4.6.3.4 Entry item <dic-item>

None.

The <dic-item> element records information for each individual entry. The same number of the elements exist as words defined. At least one instance of this element shall appear in a content. Its syntax is given in Relax NG compact format below and explained in the following text.

```
dic-item =
element dic-item {
attlist_dic-item,
(All_tag_di
| gender
| psp
| glabel
| pronunciation
| inflec
```

```
| slabel
| guideword
| spellout
| variant
| etymology)*
}
attlist_dic-item &=
attribute type { text }?,
attribute id { text },
attribute rank { text }?,
attribute level { text }?,
[ a:defaultValue = "no" ] attribute page_break { Yes_No }?,
attribute turning_page_control { Turn_Page_Val }?,
attribute revision { text }?,
attribute delete { Yes_No }?
```

type: Specifies the type of the entry in Standard character string.

May be omitted.

id: Specifies an identifier (Reference ID) for this entry.

Reference ID is used for:

a) accessing the item from the other parts of the content;

b) identifying the item in editing and updating the content.

Shall not be omitted. It is an alphanumeric character string and may be an empty string ("").

rank: Represents the importance level for this entry. (e.g. for

learners) in numerals [0-9].

level: Records the hierarchy of entries (e.g. chapter-section

hierarchy), which is otherwise lost. To be specified in numerals [0-9]. Recorded in the order of importance (i.e. the smaller, the nearer to the top of the hierarchy) though it is not required that the values be consecutively used.)

page\_break: Inserts a page break. When omitted, it defaults to "no."

"yes": insert a page break

"no": not insert a page break

turning\_page\_control: Defines how ordinary scrolling interacts with the page breaks, by allowing or forbidding crossing the page break forward or backward. The possibilities are listed

below.

"on": The page break shall not be crossed by

scrolling.

"off": The page break can be crossed by

scrolling.

"forward": The page break can be crossed by

scrolling only when moving forward.

"back": The page break can be crossed by

scrolling only when moving backward.

When omitted, the behavior should conform to the global setting defined for the dictionary data object instance (the turning\_page\_control attribute of <flow\_data>, see A.4.3.2.4).

IEC 62605:2016 © IEC 2016

revision: Specifies the revision number corresponding to the

instance of this element in a numeral not smaller than 1. May be omitted. When omitted, it is interpreted as no

revision, i.e. the first version of the content.

delete: Specifies if this element should be removed due to

revision. The following values are permitted. Once a certain instance of this element was deleted setting its delete attribute to "yes", a new instance of <dic-item> element should be added when it is restored in later

revisions. When omitted, it defaults to "no".

"ves": deleted "no": not deleted

#### [Child elements]

As shown in Relax NG compact format above.

Note the following:

- <head> shall appear exactly once at the top of inside <dic-item>;
- in <head>,<headword> shall appear at least once;
- if the <headword> element appears more than once, bookmarks and wordbook functions are applicable to the first one only;
- <external\_char> shall not appear inside <headword>.

#### [Child elements]

Only those that are specific to the <dic-item> elements are shown below.

<gender>

Gramatical gender info. <psp> can include such information without using this element, depending the policy of the publisher. Its syntax is given in Relax NG compact format below.

```
gender = element gender { attlist_gender, Inline* }
attlist gender &= empty
```

<glabel>

Denotes grammatical label (e.g. ":AmE", "Abbrev."). Its syntax is given in Relax NG compact format below.

```
glabel = element glabel { attlist glabel, Inline* }
attlist_glabel &= empty
```

Records a phonetic alphabet string. Its syntax is given in Relax NG onunciation> compact format below and explained in the following text. This element is intended for recording phonetic alphabet strings outside <headword> and <subheadword> while such usage is not prohibited. The following attributes are possible. Its syntax is given in Relax NG compact format below and explained in the following text.

```
pronunciation = element pronunciation { attlist_pronunciation, Inline* }
attlist pronunciation &=
 [ a:defaultValue = "IPA" ] attribute phonetic_notation { text }?
```

[Attributes]

phonetic\_notation: Denotes the phonetic alphabet used. Defaults to "IPA". The following values are pre-defined while other user-defined values are allowed as well. However, it is strongly recommended that "IPA" be used when reasonably applicable.

<psp>

Denotes a part of speech. Other grammatical marks indicating gender and case may be included here, depending on the policy of the publisher. Its syntax is given in Relax NG compact format below.

psp = element psp { attlist\_psp, Inline\* }
attlist\_psp &= empty

<inflec>

Denotes inflection of the word form. Its syntax is given in Relax NG compact format below.

inflec = element inflec { attlist\_inflec, Inline\* }
attlist\_inflec &= empty

<slabel>

Denotes category of the terms (e.g. "philosophy", "commerce" and their abbreviations). Its syntax is given in Relax NG compact format below.

slabel = element slabel { attlist\_slabel, Inline\* }
attlist\_slabel &= empty

<guideword>

Also denotes the category of the terms. However, they are different from <slabel> in that the latter is mandatory when the (sub)headword falls into one of the applicable categories while the former is optional and intended to be used when they are necessary to distinguish multiple definitions. Its syntax is given in Relax NG compact format below.

guideword = element guideword { attlist\_guideword, Inline\* }
attlist\_guideword &= empty

<spellout>

Specifies the repeated string that is to be either replaced with other strings (possibly a symbol) that denotes omission or simply repeated. Its syntax is given in Relax NG compact format below and explained in the following text.

spellout = element spellout { attlist\_spellout, Inline\* }
attlist\_spellout &= attribute org { text }?

[Attributes]

org

specifies the string denoting omission. This element specifies how omission should be represented in the final output.

#### Example:

```
<example><spellout org = " ~ " >spell</spellout> one's name full </example>
```

~ one's name full

<variant>

Denotes variants in a Standard character string. Its syntax is given in Relax NG compact format below.

```
variant = element variant { attlist_variant, Inline* }
attlist_variant &= empty
```

<etymology> Denotes etymological information in a Standard character string. Its syntax is given in Relax NG compact format below.

```
etymology = element etymology { attlist_etymology, Inline* }
attlist_etymology &= empty
```

## Example:

```
<dict_data>
<dict_default_attribute>...</dict_default_attribute>
<dict_body>
<dic-item page_break=" yes" turning_page_control="off">
<head>
<headword table_id="ST0001">やま【山】</headword><key>やま</key>
<headword table_id="ST0001">やま【山】</headword><key>山</key>
</head>
...
<dic-item>
<dic-item ...revision=" 2">・・・・<dic-item>
<dic-item ...revision=" 1" delete=" yes">...<dic-item>
...
</dict_body>
</dict_data>
```

#### A.4.6.4 Image object instance

Regular image file referred to by the <object> element of the text object instance (see A.4.6.2.3). In this edition of IEC 62605, it can either be a PNG file or a JPEG file.

#### A.4.6.5 Sound object instance

Regular sound file referred to by the <sound\_object\_entry> element, or in the <flip\_animation> element. In this edition of IEC 62605, MP3, AAC and SMAF files may be used.

#### A.4.6.6 Animation object instance

The following elements are eligible for animation object instances.

The image sequence animation <flip animation> defines an animation as a sequence of images changing at fixed time intervals. Written as an XML file, as follows.

## Example:

```
<?xml version="1.0" encoding="Shift JIS" ?>
<flip_animation renewal_time="500ms">
</flip animation>
```

The syntax of the <flip\_animation> element is given in Relax NG compact format below and explained in the following text.

```
flip animation =
 element flip animation {
  attlist flip animation,
  flip_animation_sound?,
  flip_animation_source+
 }
attlist_flip_animation &=
 [ a:defaultValue = "1s" ] attribute renewal time { text }?
```

# [Attribute]

renewal time: Defines the interval between image switches, written in the standard Time format for durations up to 60 s. Defaults to "1s" when omitted. However, some viewers may not be able to respect the defined delay due to capability limitations.

#### [Child elements]

<flip\_animation\_sound> Defines a sound object that is to be played simultaneously to the animation. May be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flip_animation_sound =
  element flip_animation_sound { attlist_flip_animation_sound, empty }
attlist_flip_animation_sound &=
  attribute type { text },
  attribute src { text }
```

## [Attributes]

type: Records the MIME type of the sound file. In this annex,

only "audio/mp3" is permitted. Shall not be omitted.

src: Name of the sound file, written in the standard Filename

format. Shall not be omitted. Before opening the file specified in this attribute, it shall be checked against the

type attribute.

<flip\_animation\_source> Each still image that composes the animation is recorded in separate instances of this element. There shall be at least one instance of this element. When there is more than one of this type of element in the definition of an animation object, all the images referred to by the src attribute shall have the same size. Its syntax is given in Relax NG compact format below and explained in the following text.

```
flip_animation_source =
  element flip_animation_source { attlist_flip_animation_source, empty }
attlist_flip_animation_source &=
  attribute type { text },
  attribute src { text },
  attribute renewal_time { text }?
```

# [Attributes]

type: Defines the type of image file registered by the src

attribute as a MIME type. Shall not be omitted. In the present standard, the following formats are accepted:

"image/png"

"image/jpeg"

src: Name of the image file, written in the standard Filename

format. Shall not be omitted. Before opening the file specified in this attribute, it shall be checked against the

type attribute.

renewal\_time: Time to wait before switching to the next image, written in

the standard Time format, with a maximum of 60 s. If omitted, it defaults to the value set in the renewal time

attribute of <flip animation>.

When the animation object is displayed in a loop (with the loop attribute of <object> set to more than "1"), the loop-time is determined as follows:

If the animation includes a sound file: The animation is regarded as finished when all images have been shown and the associated sound has been played entirely. Repetition starts at this point. Note that the image sequence shall be shown again from the first image.

Otherwise: The animation simply starts again after it reaches the end.

#### Example:

## A.4.6.7 Search page object instance <search\_page>

The <search\_page> element defines what is rendered on the search page. Its syntax is given in Relax NG compact format below and explained in the following text.

```
search_page =
  element search_page {
    attlist_search_page,
    search_page_title?,
    key_input_region,
    key_input_region?,
    search_link_item*
  }
attlist_search_page &= empty
```

A search page object instance is written as shown in the following example.

#### Example:

A sample rendering is shown in Figure A.7. As can be seen, it is divided in 4 regions, as described below. How these regions are visually organized is dependent on the viewer. Some viewers may even decide not to display all of them.

Title string: Region displaying the title of the search page. Defined in the

<search\_page\_title> element.

Title image: Region displaying the search page's title image. Defined in the

<search\_page\_title> element.

Keyword input field: Region to let the user input the keywords on which the search

should be based. It is composed of actual input fields, as well as explanatory strings such as "Reading?" or "Spelling?". Each line is associated with a search table, against which the keywords are matched in order to produce the search result. Defined in the <key\_input\_region>

element.

Link list: Displays a list of links to other search pages or specific parts of the

documents. Defined in the <search link item> element.

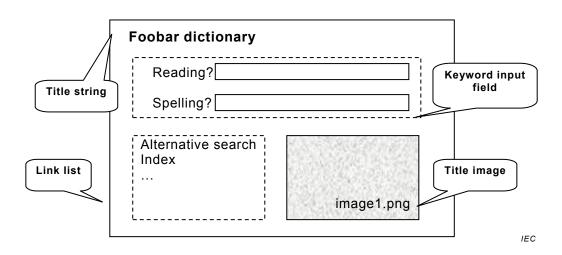

Figure A.7 - Example of search page object instance rendering

[Child elements]

IEC 62605:2016 © IEC 2016

```
following text.
```

```
search_page_title =
  element search_page_title { attlist_search_page_title, TextWithGaiji }
attlist_search_page_title &=
  attribute type { text }?,
  attribute src { text }?
```

#### [Attributes]

type:

Stores the MIME type of the image to use as a title image. May be omitted only if the src attribute is also omitted. The

possible values are listed below.

"image/png"

"image/jpeg"

src:

Sets the filename of the image to use as a title image, written in the standard Filename format. May be omitted. Before opening the file specified in this attribute, it shall

be checked against the type attribute.

#### [Child elements]

The string to be used as a title is written inside the element as an External extended character string.

# Example:

```
<search_page_title type="image/jpeg" src="image.jpg">
Foobar dictionary
</search_page_title>
```

<key\_input\_region> Defines the keyword input region. Within a single search screen, there can only be one or two instances of this element. The viewer uses this information to display the input region, and then conducts the search based on user input. Its syntax is given in Relax NG compact format below and explained in the following text.

```
key_input_region =
  element key_input_region {
    attlist_key_input_region, key_input_region_prompt, enable_key_type
  }
attlist_key_input_region &=
  attribute table_id { text },
  attribute search_type { "matches_only" | "matches_first" }
```

# [Attributes]

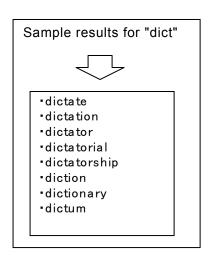

table\_id:

Records the ID number of the search table to be used as a base for the search. It corresponds to the number defined in <search\_table\_def> (see A.4.3.2.6). Not to be confused with Reference ID (see A.4.6.3.4). Shall not be omitted.

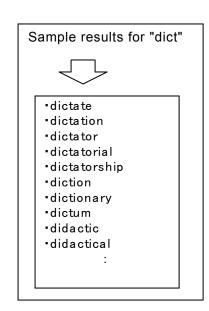

search\_type:

Defines the type of search, to be chosen from the possibilities listed below. May be omitted, and defaults to "matches only" in that case.

"matches\_only": "Matches only" search mode. The normalized (see A.4.3.2.6, <key\_normalization>) keyword is forward-matched to each entry word in the search table designated by the table\_id attribute. The result of this search is all the words that match using those criteria, and only those words.

"matches\_first": "Matches\_first" mode. The comparison method is the same as in "matches\_only", but the result list is a little different. It contains all the words matching the normalized keyword, and also the following entries in the search table.

#### [Child elements]

<key\_input\_region\_prompt> Records the character string used as a
label to the keyword input field, such as the "Reading?" or "Spelling?" shown
in Figure A.7. Shall not be omitted. Its syntax is given in Relax NG compact
format below and explained in the following text.

```
key_input_region_prompt =
  element key_input_region_prompt {
    attlist_key_input_region_prompt, TextWithGaiji
  }
attlist key input region prompt &= empty
```

#### [Child elements

The character string to be used as explained above.

<enable\_key\_type> Defines what kind of character is allowed in the keyword input field. The details of this element are given in A.4.3.2.6. The character types allowed in the search page object's <enable\_key\_type> shall be a subset of those defined in the associated search table. Shall not be omitted.

#### Example:

<search\_link\_item> Records the information defining the link list. They may point to other search tables, or to a specific position in a text flow. The jumps are handled by using the <trigger\_pointer> (see A.4.4.3) and <action\_page\_jump> (see A.4.4.3) elements. They should be recorded in the event data (see A.4.4.2) of the flow hosting this search page object. Shall not be omitted. Its syntax is given in Relax NG compact format below and explained in the following text.

```
search_link_item =
  element search_link_item {
    attlist_search_link_item, search_link_title
  }
attlist_search_link_item &= attribute char_id { text }
```

char\_id:

Defines the ID number of this search link item, written in

the standard char ID format. Shall not be omitted.

#### [Child elements]

<search\_link\_title> Sets the title of this link, that is, the text that will be displayed and act as the link. It is written as an External extended character string. Shall not be omitted. Its syntax is given in Relax NG compact format below and

explained in the following text.

```
search_link_title =
  element search_link_title { attlist_search_link_title, TextWithGaiji }
attlist_search_link_title &= empty
```

## Example:

## A.4.6.8 Movie object instance

Regular movie file referred to by the <movie\_object\_entry> element (see A.4.5.5). In this edition of IEC 62605, only 3GPP2 files are allowed.

#### A.5 Available color names

The color names that may be used in the attributes specifying color types are listed in Table A.6, with the corresponding RGB values.

Table A.6 - Color names

Color name	White	Black	Red	Green	Blue
RGB Value	#FFFFFF	#000000	#FF0000	#008000	#0000FF
Color name	Yellow	Purple	Aqua	Maroon	Navy
RGB Value	#FFFF00	#800080	#00FFFF	#800000	#000080
Color name	Olive	Teal	Gray	Silver	SlateBlue
RGB Value	#808000	#008080	#808080	#C0C0C0	#6A5ACD
Color name	MediumBlue	RoyalBlue	DodgerBlue	SkyBlue	SteelBlue
RGB Value	#0000CD	#4169E1	#1E90FF	#87CEEB	#4682B4
Color name	LightBlue	PaleTurquoise	Turquoise	Cyan	LightCyan
RGB Value	#ADD8E6	#AFEEEE	#40E0D0	#00FFFF	#E0FFFF
Color name	Aquamarine	DarkGreen	SeaGreen	LightGreen	Chartreuse
RGB Value	#7FFFD4	#006400	#2E8B57	#90EE90	#7FFF00
Color name	GreenYellow	LimeGreen	YellowGreen	OliveDrab	DarkKhaki
RGB Value	#ADFF2F	#32CD32	#9ACD32	#6B8E23	#BDB76B
Color name	PaleGoldenrod	LightYellow	Gold	Goldenrod	DarkGoldenrod
RGB Value	#EEE8AA	#FFFFE0	#FFD700	#DAA520	#B8860B
Color name	RosyBrown	IndianRed	SaddleBrown	Sienna	Peru
RGB Value	#BC8F8F	#CD5C5C	#8B4513	#A0522D	#CD853F
Color name	or name Burlywood Beige		Wheat	SandyBrown	Tan
RGB Value	iB Value #DEB887 #F5F5DC		#F5DEB3	#F4A460	#D2B48C
Color name	Chocolate	Firebrick	Brown	Salmon	Orange
RGB Value	#D2691E	#B22222	#A52A2A	#FA8072	#FFA500
Color name	Coral	Tomato	HotPink	Pink	DeepPink
RGB Value	#FF7F50	#FF6347	#FF69B4	#FFC0CB	#FF1493
Color name	PaleVioletRed	Magenta	Violet	Plum	Orchid
RGB Value	#DB7093	#FF00FF	EE82EE	#DDA0DD	#DA70D6
Color name	DarkViolet	BlueViolet	MediumPurple	Thistle	Lavender
RGB Value	#9400D3	#8A2BE2	#9370DB	#D8BFD8	#E6E6FA
Color name	MistyRose	Ivory	LemonChiffon	Moccasin	
RGB Value	#FFE4E1	#FFFFF0	#FFFACD	#FFE4B5	

#### A.6 Localization

#### A.6.1 Possible additions

The proposals made here for localization are not normative. They are given as examples of additions that should be made to the format before use for a particular language. This localization part is subject to standardization on a language-specific basis when the specification is put to use for that particular language.

#### A.6.2 Standard characters

For localization purposes, the character sets listed in Table A.7 may be used for the standard character set of the document, depending on the language.

Table A.7 – Examples of additional standard character sets

Target language	Name	Description
Japanese	"JIS X 0201,JIS X 0208:1997"	Characters in the range of Shift_JIS
English	"ISO 646-IRV"	The 7bit ASCII characters
French	"ISO 8859-15"	Characters in the range of ISO 8859-15 (Latin-9)

# A.6.3 Characters usable for reading

In addition to the basic characters allowed in the Reading data format, the language-specific extensions listed in Table A.8 are proposed.

Table A.8 - Example of additional characters usable for readings

Target language	Name	Description			
Japanese	Full-width Japanese katakana characters	ァアィイゥウェエォオカガキギクグケゲコゴサザシジスズセゼソゾタダチヂッツヅテデトドナニヌネノハバパヒビピフブプヘベベホボポマミムメモャヤュユョヨラリルレロヮワヰ スヲンヴヵヶ (U+30A1 to U+30F6)			
Japanese	Japanese long vowel mark	— (U+30FC)			
French	French alphabet extensions	À (U+00C0) È (U+00C8) Î (U+00CE) Ù (U+00D9) À (U+00E0) È (U+00E8) Î (U+00EE) Û (U+00FB)	(U+00C2) É (U+00C9) Ï (U+00CF) Û (U+00DB)  (U+00E2) É (U+00E9) Ï (U+00EF) Ü (U+00FC)	Æ (U+00C6) Ê (U+00CA) Ô (U+00D4) Ü (U+00DC) æ (U+00E6) ê (U+00EA) Ô (U+00F4) ÿ (U+0FF)	Ç (U+00C7) Ë (U+00CB) Ö (U+00D6) Ÿ (U+00DF) Ç (U+00E7) Ë (U+00EB) ù (U+00F9) Œ(U+0152)

## A.6.4 Line breaking methods

## A.6.4.1 For Japanese

Possible value for the method attribute of the <flow\_default\_line\_breaking\_method> (see A.4.3.2.3) and line\_breaking\_method> (see A.4.6.2.2) elements.

"run\_down": move characters from the end of a line to the beginning of the next one, to respect the position restrictions expressed by the <top\_prohibit\_char> and <end prohibit char> elements.

Additional attributes of the <flow\_default\_line\_breaking\_method> and line\_breaking\_method> elements when using the "run\_down" method.

hanging\_punctuation: Activates or deactivates the processing of hanging characters. Possible values are "yes" and "no". Defaults to "yes" when method is set to "run\_down". When activated, the characters listed in <hanging\_char>, instead of being displayed at the beginning of a line, should be displayed after the end (i.e. in the right margin) of the previous line. Does not apply if the character is the first of a paragraph.

Additional child elements of the <flow\_default\_line\_breaking\_method> and line\_breaking\_method> elements when using the "run\_down" method.

Example:

<end\_prohibit\_char> Lists the characters that must not appear at the end of a line, except as the last letter of the paragraph. Listed as an Extended character string. Defaults to an empty list when omitted.

Example:

<hanging\_char> Lists the characters to be displayed as hanging punctuation. Listed as an Extended character string. Defaults to an empty list when omitted.

Example:

# A.6.4.2 For English

Possible value for the method attribute of the <flow\_default\_line\_breaking\_method> and line\_breaking\_method> elements.

"word\_wrap": Line breaks can only occur on space characters, unless that would cause text to overflow the line.

## A.6.5 Sorting rules for <search\_table\_def>

The methods listed in Table A.9 are proposed.

Table A.9 - Example of additional sorting rules

Target language	Sorting_rule name	Description
Japanese	shift_jis	Characters are ranked according to their code points in the Shift_JIS encoding. Rank for characters not covered by this encoding is unspecified.
English	en	Characters are ranked according to their code points in ASCII encoding. Rank for characters not covered by this encoding is unspecified.
French	fr	Characters are sorted in the following order:
		A À Â Æ B C Ç E É È Ê Ë F G H I Î Ï J K L M N O Ô Ö Œ P Q R S T U Ù Û Ü V W X Y Ÿ Z
		The same order is valid for lower case letters too. Rank for other characters is unspecified, and may simply follow the encoding in use, or the Unicode code points.

# A.6.6 Additional attributes for <enable\_key\_type>

It is proposed that <enable\_key\_type> have the language-specific attributes listed in Table A.10 in addition to those described in A.4.3.2.6. Each accepts 2 values; "yes" and "no". Defaults to "no" when omitted.

Table A.10 - Example of additional language specific attributes for <enable\_key\_type>

Target language	Character type name	Corresponding characters (all values are in Unicode)				
Japanese	fullwidth_ numerals	0 to 9 (U+FF10 to U+FF19)				
Japanese	fullwidth_ alphabet	A to Z (U+FF21	A to Z (U+FF21 to U+FF3A) and			
		a to z (U+FF41to U+FF5A)				
Japanese	kana	Half-width katakana:				
		アイウエオカキクケコサシスセソタチツテトナニヌネノハヒフへホマミムメモヤユヨラリルレロワン^^				
		(U+FF71 to U+FF9F) and				
		ヲアイウエオヤユヨツ (U+F	F66 to U+FF6F)			
		Full-width kataka	na:			
		ァアィイゥウェエォオカガキギクグケゲコゴサザシジスズセゼソゾタダチヂッツヅテナニヌネノハバパヒビピフブプヘベベホボポマミムメモャヤュユョヨラリルレロヮワンヴヵヶ(U+30A1 to U+30F6)				
Full-width hiragana:						
		ああいいううええぉおかがきぎくぐけげこごさざしじすずせぜそぞただちぢっなにぬねのはばぱひびぴふぶぷへべぺほぼぽまみむめもゃやゅゆょよらりるれん (U+3041 to U+3093)				
		Long vowels:				
		— (U+30FC, full-	width) and - (U+FF70,	half-width)		
	kanji	To be appropriately defined, e.g. kanji characters included in JIS X 0208:1997 or JIS X 0213:2004				
French	French_al phabet_ex tensions	À (U+00C0)	(U+00C2)	Æ (U+00C6)	Ç (U+00C7)	
		È (U+00C8)	É (U+00C9)	Ê (U+00CA)	Ë (U+00CB)	
		Î (U+00CE)	Ϊ (U+00CF)	Ô (U+00D4)	Ö (U+00D6)	
		Ù (U+00D9)	Û (U+00DB)	Ü (U+00DC)	Ϋ (U+00DF)	
		à (U+00E0)	â (U+00E2)	æ (U+00E6)	ç (U+00E7)	
		è (U+00E8)	é (U+00E9)	ê (U+00EA)	ë (U+00EB)	
		î (U+00EE)	ï (U+00EF)	ô (U+00F4)	ù (U+00F9)	
		û (U+00FB)	ü (U+00FC)	ÿ (U+0FF)	Œ(U+0152)	
		œ (U+0153)				

## A.6.7 Normalization methods for <key\_normalization>

#### A.6.7.1 For Japanese language

Additional attributes of the <key normalization> element (see A.4.3.2.6).

cho\_on: Japanese long vowel (cho on) conversion method. Possible values are

"delete" (remove the character), "repeat" (repeat the vowel preceding the

character) and "no" (do nothing). Defaults to "delete".

daku on: Japanese voiced sound (daku on) conversion. Possible values are "yes"

(convert to unvoiced, or sei on) and "no" (no conversion). Defaults to "no".

handaku\_on: Japanese semi-voiced sound (handaku on) conversion. Possible values are

"yes" (convert to unvoiced) and "no" (no conversion). Defaults to "no".

soku\_on: Japanese geminate consonant (soku on or "small tsu") conversion. Possible

values are "yes" (convert to large character) and "no" (no conversion).

Defaults to "no".

yo\_on: Japanese palatalization (yo on) conversion. Possible values are "yes"

(conversion to large character) or "no" (no conversion). Defaults to "no".

other\_small\_kana: Other Japanese small character (hiragana and katakana) conversion.

Possible values are "yes" (convert to large character) and "no" (do not

convert). Defaults to "no".

In addition to the methods controlled by the preceding parameters, the following normalization process should be applied all the time.

All alphanumeric characters, both full-width and half-width, should be normalized to half-width.

All Japanese hiragana and katakana, both full-width and half-width, should be normalized to full-width katakana.

#### A.6.7.2 For French language

Additional attributes of the <key\_normalization> element.

diactritic\_removal: drops all diacritics (accents, tremas, and cedilla) from the letters that carry them. Possible values are "yes" and "no". Defaults to "no".

#### A.6.8 Character encoding conversions

Converting a piece of text from one character encoding to another can bring some ambiguities, since different encodings, even for the same language, will sometimes cover slightly different character sets. During the localization process, such ambiguities should be considered, and the preferred conversion schemes should be specified.

The W3C's XML Japanese profile (<a href="http://www.w3.org/TR/japanese-xml/">http://www.w3.org/TR/japanese-xml/</a>) is a good example of referencing such ambiguities in the Japanese language.

#### A.7 Adaptation

This annex specifies only the most basic media files as usable. It is to be understood that other media files may be used with media types and other values appropriately defined as needed.

# A.8 Specification of the XMDF-LeXML format in the RELAX NG syntax

The syntax of the XMDF-LeXML format is formally given here as a compact RELAX NG schema. Note that it does not include any localization-related addition.

namespace a = "http://relaxng.org/ns/compatibility/annotations/1.0"

```

# Annex B (normative)

### LeXML format

### B.1 General

The LeXML (LEXicographical eXtensible Markup Language) is a format which aims for structural description of dictionaries, glossaries and encyclopaedias. The format is defined and has been extended on the input from the actual work to represent these contents in XML.

The format is capable of representing monolingual, bilingual and multilingual dictionaries of various sizes, ranging from "pocket" to unabridged dictionaries.

### **B.2** Elements for content structure

# **B.2.1** Parameter entity definition

#### B.2.1.1 %inline.html

LeXML elements consist of two categories. The first category shows HTML-like elements as presented in the (document type definition) DTD below.

NOTE  $\,$  For definitions that appear in the Relax NG compact representation of each element in this annex, see Clause B.4.

!ENTITY % inline.html "	
b	
br	
em	
i	
nobr	
span	
sub	
sup	
u	
ruby	
a	
img	

big |

small

">

# B.2.1.2 %inline.lexml

The second category shows the elements defined by LeXML, as listed in the DTD below.

```
<!ENTITY % inline.lexml "
        alabel |
        glabel |
        slabel |
        pos |
        gender |
        pron |
        svoc |
        ref |
        xref |
        inflec |
        lang |
        spellout |
        variant |
        hidden |
        light |
        sc |
       oblq |
        audio |
        video |
        note |
```

url |

```

mlg |
gi |
fbox |
pro-n | pro-v | pro-nv |
abbr | fullform">
```

# **B.2.2** Root elements

# B.2.2.1 dic-body

The root element.

NOTE In pratical applications, it is sometimes preferred to treat data without the root element, i.e. sequence of dic-item elements.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT dic-body (split | dic-item)*>
[Attributes]
```

None.

## **B.2.2.2** split

Specifies the delimiter between lexicographical blocks (e.g. this element may be used between the last word starting with "A" and the first word starting with "B"). This element is intended to record the starting points of such blocks as well as what strings should be rendered for that (e.g. "-B-" for a block consisting of words starting with "B".)

The syntax of the element is shown in the DTD below.

```
<!ELEMENT split (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST split type CDATA #IMPLIED>

[Attributes]
type
(optional) Specifies the type.
```

## Example:

```
<split>A</split>
<dic-item id="A0000100" rank="01">
<head><headword>a, A</headword>....</head>....</dic-item>
<dic-item id="A0000200" rank="compound">
<head><headword>&diams;A battery</headword>....</head>....</dic-item>
.....</dic-item id="A0406100" rank="04">
<head><headword>az · ure</headword>....</head>....</dic-item>
<split>B</split>
<dic-item id="B0000100" rank="01">
<head><headword>b, B</headword>....</head>....</dic-item>
<dic-item id="B0000200" rank="compound">
<head><headword>&diams;B battery</headword>....</head>....</hi>
```

NOTE XML representation examples may include entities for characters that are not XML standard in this annex. Their values are not given in this standard as they are not essential for understanding the format and such entities are outside the scope of this standard.

#### B.2.2.3 dic-item

Defines the logical structure of the entry. This is used as a unit to be used for search and display. Cannot be omitted.

The syntax of the element is shown in the DTD below.

### [Attributes]

id: Specifies an ID of the logical structure (item). Cannot be omitted.

type: (optional) Specifies the type for the logical structure (item).

Attribute value examples: "parent\_headword", "kanji\_representation".

rank: (optional) Specifies the category such as "important word" for the logical structure (item).

level: (optional) Specifies the information of the hierarchical position/level (in semantics) of the logical structure (item).

Attribute value examples: "14\_kanagawa", "14100\_yokohama\_kanagawa", "1410\_tsurumiward yokohama kanagawa".

orgid: (optional) Specifies the original ID when renumbered, such as the ID in the older version and the ID for management of the source data.

pid: (optional) Specifies an ID of apparent entry (Note that it is given as a sibling dic-item element) when this element is a child entry of another headword.

sortkey:(optional) Specifies the key for sorting the entries.

(paper-form)

plasma /plázma/ [noun] [U] 1 (ANATOMICAL) =blood ~ 2 whey; milk serum 3 (BIOLOGICAL) protoplasm 4 (PHYSICAL) plasma; ionized gas

<dic-item id="P0287900#000000" rank="04"> <head> <headword>plasma</headword> <key type="04">plasma</key> <headword type="pronunciation">pl&aeacute;zm&schwa;</headword> </head> <meaning subid="P0287900#NN00000"><pos>noun</pos><pos>U</pos></meani ng> <meaning subid="P0287900#NN01000" level="1" no="01"><b>1</b> <slabel>ANATOMICAL</slabel> =<ref refid="B0247800#000000">blood <spellout org=" ~ ">plasma</spellout></ref></meaning> <meaning subid="P0287900#NN02000" level="1" no="02"><b>2</b> whey; milk serum</meaning> <meaning subid="P0287900#NN03000" level="1" no="03"><b>3</b> <slabel>BIOLOGICAL</slabel>protoplasm</meaning> <meaning subid="P0287900#NN04000" level="1" no="04"><b>4</b> <slabel>PHYSICAL</slabel>plasma; ionized gas</meaning> </dic-item>

NOTE Some examples of XML in this annex include visual representations preceding or succeeding a downward arrow like the one above. Those preceding the downward arrow are for paper-form (not necessarily having corresponding XML data), while those succeeding the downward arrow are for digital representation. This reflects the situation where a large volume of XML data has been produced through conversion from paper-form contents.

# B.2.3 headword-related elements

#### B.2.3.1 head

Denotes a block consisting of the headword and other data that forms a set with it (representation, pronunciation, search key, etc.). Cannot be omitted.

The syntax of the element is shown in the DTD below.

<!ELEMENT head (headword | key)\*>

[Attributes]

None.

### pyr-a-mid /pframid/

- <head>
- <headword>pyr· a· mid</headword>
- <key>pyramid</key>
- <headword type="発音">p&iacute;r&schwa;m&igrave;d</headword>
- </head>

Example:

# エジプト Egypt 【埃及】

- <head>
- <headword>エジプト</headword>
- <key>エジプト</key>
- <headword type="原綴">Egypt</headword>
- <key type="原綴">Egypt</key>
- <headword type="漢字">埃及</headword>
- <key type="漢字">埃及</key>
- </head>

#### B.2.3.2 headword

Specifies the headword and other data that form a set with it. Cannot be omitted.

The syntax of the element is shown in the DTD below.

<!ELEMENT headword (#PCDATA | %inline.html; | %inline.lexml;)\*>

delimiter CDATA #IMPLIED >

[Attributes]

type

(optional) Used to distinguish the main headwords (usually do not have this attribute) from other headwords. For example, being a variant representation of the headword and/or pronunciation info may be indicated by this attribute.

Attribute value examples: "Kanji representation", "pronunciation", "original spelling".

delimiter

(optional) Specifies the symbol to be used when part of the content needs to be placed in the the preceding element for printing.

### B.2.3.3 key

Specifies a keyword to search for a dic-item element. Usually used below the headword element that is to be displayed/printed.

NOTE The appearance of a key element is not limited within the head block.

The syntax of the element is shown in the DTD below.

<!ELEMENT key (#PCDATA)>
<!ATTLIST key type CDATA #IMPLIED >

[Attributes]

type

(optional) Usually, keys without the type attribute are treated as main headword keys. Variant representations and readings of the main headword are specified using type attributes.

Attribute value examples: "representation", "kana", "original\_spelling".

(paper-form)

permission [consent] chiefly BrE official permission to construct a new building or alter an existing one (AmE • AusE building permit)

<dic-item id="P0285900#000000" rank="compound">

<head>

<headword><spellout org="&swangacute;">pl&aacute;nning</spellout>

permìssion [consènt] </headword>

<key type="compound">planning permission</key>

<key type="compound">planning consent</key>

</head>

<meaning><alabel>chiefly BrE</alabel>official permission to construct a

new building or alter an existing one ( <alabel>AmE ·

AusE</alabel>building permit ) </meaning>

</dic-item>

#### B.2.4 Main-text related elements

# B.2.4.1 meaning

Specifies word definitions and similar explanations such as usage, notes. Can appear more than once, generally together with example and other elements, which will be explained below.

The syntax of the element is shown in the DTD below.

<!ELEMENT meaning (#PCDATA | %inline.html; | %inline.lexml;)\*>

<!ATTLIST meaning subid ID #IMPLIED

type CDATA #IMPLIED

level CDATA #IMPLIED

no CDATA #IMPLIED >

# [Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring.)

type

(optional) Specifies a type of definition.

Attribute value examples: "explanation", "synonym", "etymology", "note".

level

(optional) Specifies the hieararchical level for the definition number in an entry.

no

(optional) Specifies the definition number.

Example:

(paper-form)

1 (1) 人の氏名。姓名。(2) 姓に対しての、名。 2 事物の名称。(1) 一般の名称。(2) 固有の名称。 類語 人名・氏名・姓名・姓氏・姓・名字…

<meaning level="1" no="1">&bf1; </meaning>

<meaning level="2" no="1">&pr1; 人の氏名。姓名。</meaning>

<meaning level="2" no="2">&pr2; 姓に対しての、名。</meaning>

<meaning level="1" no="2">&bf2; 事物の名称。</meaning>

<meaning level="2" no="1">&pr1;一般の名称。</meaning>

<meaning level="2" no="2">&pr2; 固有の名称。</meaning>

<meaning type="類語">人名・氏名・姓名・姓氏・姓・名字...</meaning>

## B.2.4.2 example

Gives examples. Each example should be enclosed in one example element. It shall be repeatable.

The syntax of the element is shown in the DTD below.

<!ELEMENT example (#PCDATA | %inline.html; | %inline.lexml;)\*>
<!ATTLIST example subid ID #IMPLIED

type CDATA #IMPLIED

delimiter CDATA #IMPLIED >

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Used to distinguish the type of the example when necessary.

delimiter

(optional) Specifies the symbol to be used when part of the content needs to be placed in the preceding element for printing.

#### (paper-form)

mèd-icátion /-kéij⊕n/ [noun] [U] [C] medicine; a drug || The doctor prescribed ~ for the pain.
/ Her ~s did not agree with her.

- <dic-item id="M0139700#000000" rank="03">
- <head>
- <headword>m&egrave;d-ic&aacute;tion</headword>
- <key type="03">medication</key>
- <headword type="pronunciation">-k&eacute;
- <sc>l</sc>&esh;<i>&schwa;</i>n</headword>
- </head>
- <meaning subid="M0139700#NN00000"><pos>noun</pos><pos>U</pos>
- <pos>C</pos>medicine; a drug</meaning>
- <div type="example">
- <example delimiter="|| ">The doctor prescribed <spellout org=" ~ ">
  medication</spellout> for the pain.</example>
- <key type="example">The;doctor;prescribe;medication;for;the;pain</key>
- <example delimiter="/">Her <spellout org=" ~ s">medications</spellout>
  did not agree with her.
- <key type="example">Her;medication;did;do;not;agree;with;her</key> </div>
- </dic-item>

(paper-form)

1 遊び道具。おもちゃ。「をかしき絵、一ども」〈源・若紫〉

2 楽器。「多くの─の音」〈源・常夏〉

Example:

(paper-form)

1 よい、満足できる、すぐれた、りっぱな。 $\|$  a  $\sim$  dictionary よい辞書 /  $\sim$  land 肥沃な土地 2 正当な;(…に) ふさわしい;(…するのに) 適した《to do》。 $\|$   $\sim$  for nothing 《略式》何の役にも立たない / a  $\sim$  place to live (in) 住みよい場所

<meaning level="1" no="1">&bf1; よい,満足できる,すぐれた,りっぱな。</meaning>

<example delimiter=" $\|$ ">a  $\sim$  dictionary | & U dictionary</example>

<example delimiter="| ">~ <i>for</i> nothing | 《略式》何の役に も立たない

<example delimiter="/">a ~ place <i>to</i> live (in) | 住みよい場所
</example>

#### B.2.5 Subheadword related elements

#### B.2.5.1 Subhead

Specifies the subheadword such as a derived word, compound, and related info consisting of meaning, example and key elements in a set.

The syntax of the element is shown in the DTD below.

[Attributes]

subid

(optional) Specifies an id for this child element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type of the subheadword.

delimiter

(optional) Specifies the symbol to be used when part of the content needs to be placed in the preceding element for printing.

## B.2.5.2 subheadword

Specifies a subheadword.

The syntax of the element is shown in the DTD below.

[Attributes]

type

(optional) Specifies the type for the subheadword such as a derived word and a compound.

#### delimiter

(optional) Specifies the symbol to be used when part of the content needs to be placed in the preceding element for printing.

## Example:

(paper-form)

```
old /óuld, AmE+ óuwəld/ orininal meaning: well-nourished, fully grown

— [adjective] (~·er[est]; eld·er /éldər/, eld·est /éldəst/)

1 [usu. after a mumeral] of a specified age || a six-year-~ child (=a child six years ~) / How ~
is she? (=What age is she?)

2 having lived for a long time; no longer young (⇔ young); [the ~; pl.] old people

:
5 [attrib.] a conventional; long-estabulished; familiar b former; belonging to the past

:
àny óld ... ((INFORMAL)) (1) any; any item of a particular type || eat any ~ thing / Don't give me any ~ excuse. (2) [not any ~] special or famous; neither common nor ordinary

:
the Old Mán of the Séa

— [noun] [C] [in combination] a human or animal (especially, a bird) of the age specified

: of óld ((LITERARY)) (1) belonging to the past (2) in the past; since past times
```

(continued)

```
<example delimiter="l">a six-year-<spellout org="&swang;">old</spellout>

# B.2.6 Other block elements

#### **B.2.6.1** index

A block element used for expressing various indices. Alternatively, the column element can be used for this purpose with the type attribute being set to "index".

The syntax of the element is shown in the DTD below.

<!ELEMENT index (meaning | indexlist)\*>
<!ATTLIST index subid ID #IMPLIED

type CDATA #IMPLIED >

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type for the index.

# B.2.6.2 indexlist

Gives the detailed information for the index.

The syntax of the element is shown in the DTD below.

<!ELEMENT indexlist (#PCDATA | %inline.html; | %inline.lexml;)\*>

<!ATTLIST indexlist type CDATA #IMPLIED >

[Attributes]

type

(optional) Specifies the type for the index.

Example:

(paper-form)

# institution

original meaning: someting which has been established

- establishment (<u>noun</u> 3)
  - |- structure and organization (noun 1) ······an organization founded for a particular purpose
  - custom (noun 2) .....an established practice

#### noun

- 1 [C] a large and important organization, such as a university or bank; the building which the organization possesses || an *educational* [academic] *institution* / *institutions* of higher education / a mental *institution*
- 2 □ a custom or system that has existed for a long time | political institutions / the institution of marriage
- 3 <u>□</u> founding, foundation, setting up, establishment, start ∥ the *institution* of a bank

```

```

#### **B.2.6.3** column

Denotes the text data that comprises a boxed article or column.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT column (title | key | meaning | example | subhead)*>
<!ATTLIST column subid ID #IMPLIED

type CDATA #IMPLIED >
```

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type.

Attribute value examples: "usage", "synonyms", "culture", "rel-inf" (abbreviation for "related information").

# B.2.6.4 div

Specifies general-purpose block elements.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT div (title | key | meaning | example | subhead)*>
<!ATTLIST div subid ID #IMPLIED

level CDATA #IMPLIED

type CDATA #IMPLIED >
```

[Attributes]

subid

(optional) Specifies an id for this child element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type for the block.

level

(optional) Specifies a position in the hierarchy.

# **B.2.6.5** title

Specifies title for the block defined by column or div elements.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT title (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST title type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type for the title.

## **B.2.7** Media related elements

## **B.2.7.1** image

Specifies a non-inline image file. (For inline image files, use an img element instead.)

The syntax of the element is shown in the DTD below.

[Attributes]

type

(optional) Specifies the type for the image.

src

Specifies the file name.

mime-type

(optional) specifies the MIME type.

Attribute value examples: "image/gif", "image/jpeg", "image/png".

#### **B.2.7.2** audio

Specifies an audio source file.

The syntax of the element is shown in the DTD below.

<!ELEMENT audio EMPTY>
<!ATTLIST audio type CDATA #IMPLIED

src CDATA #REQUIRED

mime-type CDATA #IMPLIED >

[Attributes]

type

(optional) Specifies the type of the audio (such as audio content).

src

Specifies the file name.

mime-type

(optional) Specifies the MIME type.

Attribute value examples: "audio/mpeg", "audio/vnd.rn-realaudio", "audio/wav".

## **B.2.7.3** video

Specifies a movie file. Can be used to introduce either inline or non-inline video objects.

[Child elements]

The syntax of the element is shown in the DTD below.

[Attributes]

type

(optional) Specifies the type of the video (such as video content).

src

Specifies the file name.

mime-type

(optional) Specifies the MIME type.

Attribute value examples: "video/mpeg", "video/x-msvideo", "application/x-shockwave-flash".

#### **B.2.8** Other structural elements

## B.2.8.1 p

Specifies paragraphs.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT p (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST p subid ID #IMPLIED

type CDATA #IMPLIED >
```

[Attributes]

subid

(optional) Specifies an id for this child element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type of the text data.

#### B.2.8.2 Unordered list

## B.2.8.2.1 ul

Used to introduce an unordered list.

The syntax of the element is shown in the DTD below.

<!ELEMENT ul (li)+>

<!ATTLIST ul subid ID #IMPLIED type CDATA #IMPLIED >

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type for the list.

#### B.2.8.2.2 I

Used to introduce an item in the list.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT li (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST li subid ID #IMPLIED

type CDATA #IMPLIED >
```

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type for the item.

#### B.2.8.3 Definition list

#### B.2.8.3.1 dl

Definition list.

```
<!ELEMENT dl (dt|dd)+>
<!ATTLIST dl subid ID #IMPLIED
type CDATA #IMPLIED >
```

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type.

## B.2.8.3.2 dt

The syntax of the element is shown in the DTD below.

```
<!ELEMENT dt (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST dt subid ID #IMPLIED

type CDATA #IMPLIED >
```

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type.

#### B.2.8.3.3 dd

The syntax of the element is shown in the DTD below.

```
<!ELEMENT dd (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST dd subid ID #IMPLIED

type CDATA #IMPLIED >
```

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

type

(optional) Specifies the type.

## **B.2.8.4** Table-related elements

#### B.2.8.4.1 table

Specifies a table.

The syntax of the element is shown in the DTD below.

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring).

# **B.2.8.4.2** caption

The syntax of the element is shown in the DTD below.

```
<!ELEMENT caption (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST caption type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type.

## B.2.8.4.3 tr

The syntax of the element is shown in the DTD below.

```
<!ELEMENT tr (th | td)*>
```

[Attributes]

None.

#### B.2.8.4.4 th

The syntax of the element is shown in the DTD below.

```
<!ELEMENT th (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST th colspan NMTOKEN #IMPLIED >
```

[Attributes]

colspan

(optional) Specifies the number of columns spanned by the current cell.

#### B.2.8.4.5 td

The syntax of the element is shown in the DTD below.

```
<!ELEMENT td (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST td colspan NMTOKEN #IMPLIED
rowspan NMTOKEN #IMPLIED >
```

[Attributes]

colspan

(optional) Specifies the number of columns spanned by the current cell.

rowspan

(optional) Specifies the number of rows spanned by the current cell.

## B.2.8.5 replace

Specifies the file that can replace the text enclosed by the src attribute.

```
<!ELEMENT replace (meaning | example | subhead)*>
<!ATTLIST replace subid ID #IMPLIED

type CDATA #IMPLIED

src CDATA #REQUIRED >
```

[Attributes]

subid

(optional) Specifies an id for this element, usually derived from the id attribute value of the ancestor dic-item element (typically the former including the latter as a substring.

type

(optional) Specifies the type.

src

As a principle, image file name that can be replaced with the text in the replace block is to be specified. The file name extension is needed so that the file can be handled without MIME type.

## Example:

#### B.2.8.6 memo

Specifies memo data for editing and management purposes.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT memo (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST memo type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type.

#### B.2.8.7 data

Specifies infomation for database processing such as categorization and sorting information.

```
<!ELEMENT data (#PCDATA | %inline.html; | %inline.lexml;)*>
```

ATTLIST data type CDATA #IMPLIED
[Attributes]
type
(optional) Specifies the type.
B.3 Inline elements
B.3.1 Labels
B.3.1.1 alabel
Denotes regional label.
The syntax of the element is shown in the DTD below.
ELEMENT alabel (#PCDATA   %inline.html;   %inline.lexml;)* ATTLIST alabel type CDATA #IMPLIED
[Attributes]
type
(optional) Specifies a type.
Example:
<alabel>usu. AmE</alabel>

## B.3.1.2 glabel

Denotes grammatical/speech label.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT glabel (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST glabel type CDATA #IMPLIED >

[Attributes]
```

type

(optional) Specifies a type.

Attribute value examples: "word-form", "attributive".

Example:

<glabel>INFORMAL</glabel>

```
<headword>your</headword>
    :
<meaning><pos>pron</pos> <glabel type="限定">you の所有格</glabel> <b>あなた(がた) の</b>; <glabel type="語層">話</glabel> 例の, いわゆる; <glabel type="語形">Y-</glabel> 貴人への呼びかけ.</meaning>
```

#### B.3.1.3 slabel

Denotes category of the terms.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT slabel (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST slabel type CDATA #IMPLIED >

[Attributes]
```

type

(optional) Specifies a type.

Example:

<slabel>MEDICAL</slabel>

# B.3.2 pronunciation/accent - related elements

## **B.3.2.1** accent

Accent information. To be used for description of accent and intonation in other places than headwords and pronuncation information.

```
<!ELEMENT accent (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST accent type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type.

## Example:

## B.3.2.2 pron

Specifies pronunciation information in inline manner. Pronunciation information of the headword should be basically written in headword elements with type attribute specified accordingly.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT pron (#PCDATA)>
```

[Attributes]

None.

#### B.3.2.3 pha

Provides pronunciation information based on the phonetic alphabet (thus the name "pha"). While the type attribute can specify the type such as IPA and pinyin, dedicated elements can alternatively be used.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT pha (#PCDATA | %inline.html; | %inline.lexml;)*> <!ATTLIST pha type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type as described above.

Attribute value examples: "ipa", "pinyin", "respelling", "us\_respelling".

## B.3.2.4 ipa

Provides pronunciation information based on the International Phonetic Alphabet.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT ipa (#PCDATA | %inline.html; | %inline.lexml;)*>
```

[Attributes]

None.

Example:

```
<headword type="見出">ABC<sup>1</sup></headword>
<headword type="発音"><ipa>&eacute;ib&igrave;&length;s&iacute;&length;</ipa>
<b>エ</b>イビー<b>スィ</b>ー</headword>
:
<meaning><POS>名</POS> (複 ABC's, ABCs pron><ipa>-z</ipa></pron>) </meaning>
```

## B.3.2.5 pinyin

Provides pronunciation information based on pinyin (the Chinese phonetic alphabet), mainly used in Chinese language contents.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT pinyin (#PCDATA | %inline.html; | %inline.lexml;)*>
```

[Attributes]

None.

## B.3.3 Part-of-speech related and other elements

## B.3.3.1 pos

Denotes a part of speech. Other symbols can be specified here.

<!ELEMENT pos (#PCDATA)>

[Attributes]

None.

# B.3.3.2 gender

Gramatical gender info. Alternatively the pos element can include such information instead of using this element, depending on the policy of the publisher.

The syntax of the element is shown in the DTD below.

<!ELEMENT gender (#PCDATA)>

[Attributes]

None.

# B.3.4 Other dictionary-specific elements

#### B.3.4.1 abbr

When the headword is not in an abbreviated form, the corresponding abbreviation is given by the abbr element.

The syntax of the element is shown in the DTD below.

<!ELEMENT abbr (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

Example:

<headword>Lexicographical Extensible Markup Language</headword>
 :
<meaning><abbr>LeXML</abbr>. 辞書・事典に特化した XML 仕様。</meaning>

#### B.3.4.2 article

To specify the definite article(s) that is/are written in the headword but to be ignored for sorting purposes.

<!ELEMENT article (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

Example:

(paper-form)

die Ar·go

<headword><article>die</article> <ud>A</ud>r · go</headword>

# B.3.4.3 etym

Denotes etymological information. Using the meaning element with its type attribute set "etymology" (or anything regarded appropriate) is recommended.

The syntax of the element is shown in the DTD below.

<!ELEMENT etym (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

#### B.3.4.4 ex

Denotes inline usage/phrase examples.

The syntax of the element is shown in the DTD below.

<!ELEMENT ex (#PCDATA | %inline.html; | %inline.lexml;)\*>
<!ATTLIST ex type CDATA #IMPLIED >

[Attributes]

type

(optional) Specifies the type.

#### B.3.4.5 fullform

When the headword is in its abbreviated form, it denotes the full form.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT fullform (#PCDATA | %inline.html; | %inline.lexml;)*>
[Attributes]
```

None.

## Example:

# **B.3.4.6** inflec

Denotes inflections.

The syntax of the element is shown in the DTD below.

<!ELEMENT inflec (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

# B.3.4.7 lang

Specifies the original language of the word.

```
<!ELEMENT lang (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST lang type CDATA #IMPLIED >
```

[Attributes]
type
(optional) Specifies the type.
B.3.4.8 note
Denotes notes.
The syntax of the element is shown in the DTD below.
ELEMENT note (#PCDATA   %inline.html;   %inline.lexml;)* ATTLIST note type CDATA #IMPLIED
[Attributes]
type
(optional) Specifies the type.
B.3.4.9 pro-n
Denotes pronouns, typically in fixed phrases and examples. This element is supposed to be used in emphasizing or visually distinguishing such pronouns.
The syntax of the element is shown in the DTD below.
ELEMENT pro-n (#PCDATA   %inline.html;   %inline.lexml;)*
[Attributes]
None.
Example 1:

 $\label{lem:condition} $$\sup_{n\to\infty} \sup_{n\to\infty} \sup_{n$ 

Example 2:

(paper-form)

tàke one's chánces 好機をとらえる.

<subheadword type="成句">t&agrave;ke <pro-n>one's</pro-n>ch&aacute;nces</subheadword><meaning>好機をとらえる.</meaning>

# Example 3:

(paper-form)

sich3 den Finger an der Tür abklemmen ドアに指をはさまれる

<example><pro-n>sich<sup>3</pro-n> den Finger an der T&uuml;r abklemmen | ドアに指をはさまれる</example>

# B.3.4.10 pro-v

Denotes pro-verbs, typically in fixed phrases and examples. This element is supposed to be used in emphasizing or visually distinguishing such pro-verbs.

The syntax of the element is shown in the DTD below.

<!ELEMENT pro-v (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

# Example 1:

<subheadword subid="P0322600#SK00120">make a point of v>do/pro-v> ing</subheadword>

# Example 2:

(paper-form)

# còme clóse to dóing もう少しで…するところだ

<subheadword type="成句">c&ograve;me cl&oacute;se to <prov>d&oacute;</pro-v>ing</subheadword>
<meaning>もう少しで…するところだ</meaning>

#### B.3.4.11 svoc

Used to enclose the symbols for sentence structure, typically denoting S, V, O, C for subject, verb, object and complement, respectively.

The syntax of the element is shown in the DTD below.

<!ELEMENT svoc (#PCDATA | sub)\*>

[Attributes]

None.

## **B.3.4.12** variant

Denotes alternate spelling(s) of headwords.

```
<!ELEMENT variant (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST variant type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type.

#### B.3.4.13 ymd

Denotes the year of birth. The element can be used to denote the similar concepts such as incumbency.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT ymd (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST ymd type CDATA #IMPLIED >
```

#### Example:

```
<meaning subid="T0128600#NN00000"><pos> [ noun ]
</pos><b>Margaret (Hilda) Thatcher</b> <gender> ( f )
</gender><ymd>1925</ymd>—<ymd>2013</ymd> ; British
Conservative stateswoman ; Prime Minister ( <ymd>1979</ymd>—
<ymd>90</ymd> ) .</meaning>
```

#### B.3.4.14 cn, jp, kr, tw

#### B.3.4.14.1 General

(Mainly for Chinese language contents) Denotes the region for specifying glyphs for Unicode-coded strings.

While the same concept can be alternatively expressed using the <span> element with the lang attribute, the following four elements are defined to facilitate maintenance of the contents. Note that, for the sake of brevity, the names of the elements are not the same as the country codes.

#### B.3.4.14.2 cn

Denotes "simplified Chinese".

ELEMENT cn (#PCDATA   %inline.html;   %inline.lexml;)*
[Attributes]
None.
B.3.4.14.3 jp
Denotes "Japanese".
The syntax of the element is shown in the DTD below.
ELEMENT jp (#PCDATA   %inline.html;   %inline.lexml;)* [Attributes]
None.
B.3.4.14.4 kr
Denotes "Korean".
The syntax of the element is shown in the DTD below.
ELEMENT kr (#PCDATA   %inline.html;   %inline.lexml;)*
[Attributes]
None.
B.3.4.14.5 tw
Denotes "traditional Chinese".
The syntax of the element is shown in the DTD below.
ELEMENT tw (#PCDATA   %inline.html;   %inline.lexml;)*
[Attributes]
None.

## B.3.4.15 ggk

(Mainly in dictionaries for primary/grade school children) Denotes the grade where the kanji is to be taught.

The syntax of the element is shown in the DTD below.

<!ELEMENT ggk (#PCDATA | %inline.html; | %inline.lexml;)\*>
<!ATTLIST ggk class CDATA #REQUIRED

yomi CDATA #REQUIRED >

[Attributes]

class

(optional) Specifies the grade.

This attribute takes the following values.

*n* (numeral): Kanji is learned in grade *n*.

If *n* equals 1, kanji is always displayed as is.

Otherwise, if the grade of the reader is smaller than n, the reading given by the yomi attribute is to be shown instead of the kanji. If not, kanji is displayed as is.

Note that specifying a value larger than any grade for n expresses the idea that kanji is not taught at the primary/grade schools.

nx (numeral + "x"): Kanji is learned in grade n. However the reading given by the yomi attribute should always be shown instead of kanji regardless of the grade of the reader.

yomi

(optional) Specifies the reading that is to be shown in place of kanji. In Japanese, the reading is called "kana".

<headword type="学年別表示"><ggk class="4" yomi="む">無</ggk><ggk class="2" yomi="けい">形</ggk><ggk class="1" yomi="ぶん">文
</ggk><ggk class="3" yomi="か">化</ggk><ggk class="5" yomi="ざい">財
</ggk></headword>

(digital representation, depending on the reader's grade)

Reader's grade = 1 ... 無形文化動

Reader's grade = 4 ... 無形文化財

Reader's grade = 5 ... 無形文化財

Reader's grade = 6 ... 無形文化財

#### B.3.4.16 hs

(Mainly in German language contents) Denotes whether the verb takes haben or sein for the auxiliary verb in the perfect tense.

The syntax of the element is shown in the DTD below.

<!ELEMENT hs (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

# B.3.4.17 kigo

Denotes a kigo, or the word symbolizing the season, in Japanese poetry. Note that it is not the kigo itself but the season symbolized by the kigo that is to be enclosed by the tags as shown in the example below, where the kigo element encloses the season "夏" and not "青梅".

The syntax of the element is shown in the DTD below.

```
<!ELEMENT kigo (#PCDATA | %inline.html; | %inline.lexml;)*>
```

[Attributes]

None.

## Example:

```
<headword type="表記">青梅</headword>
   :
<meaning>まだ熟していない青い梅の実。<kigo>夏</kigo></meaning>
```

#### B.3.5 Text-decoration related elements

## B.3.5.1 b

Denotes the strings are shown in bold.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT b (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST b type CDATA #IMPLIED

class CDATA #REQUIRED >
```

[Attributes]

type

(optional) Specifies the type.

# Example:

```
<headword>Al·cott</headword>
:
<meaning><POS>名</POS> <pos>固</pos> <B type="人 名">Louisa May ~</B> オールコット</pr>
<ymd type="生没年">1832- 88</ymd>)《米国の女流作家》.
.
```

## B.3.5.2 big

Denotes the part that should be shown in (relatively) larger size. Its use is not recommended.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT big (#PCDATA | %inline.html; | %inline.lexml;)*>
```

[Attributes]

None.

# B.3.5.3 em

Denotes the part that should be shown in bold italic or emphasized by other means.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT em (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST em type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type.

#### B.3.5.4 i

Denotes the part to be shown in italic. Note that some reading systems do not distinguish italic and oblique styles. The oblq element should be used to explicitly stipulate the oblique style.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT i (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST i type CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type.

## B.3.5.5 small

Denotes the part to be displayed in smaller fonts. This element is left for compatibility reasons and its use is not recommended.

The syntax of the element is shown in the DTD below.

<!ELEMENT small (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

## B.3.5.6 sub

Denotes the part to be displayed in subscript.

The syntax of the element is shown in the DTD below.

<!ELEMENT sub (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

# B.3.5.7 sup

Denotes the part to be displayed in superscript. One of the applications is to give readings to old Chinese text as shown in the example below.

The syntax of the element is shown in the DTD below.

<!ELEMENT sup (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

李下<sup>二</sup>不<sub>レ</sub>正<sup>サ</sup><sub>レ</sub>冠<sup>ヲ</sup>

(digital representation)

#### B.3.5.8 u

Underline the text.

The syntax of the element is shown in the DTD below.

<!ELEMENT u (#PCDATA | %inline.html; | %inline.lexml;)\*>
<!ATTLIST u type CDATA #IMPLIED >

[Attributes]

type

(optional) Specifies the type.

## B.3.5.9 fbox

Surround the text with a box. This is expected to be used with relatively short text and for paragraphs, the column element should be used.

The syntax of the element is shown in the DTD below.

<!ELEMENT fbox (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

## B.3.5.10 light

Denotes the part for which text decoration is cancelled that is specified for the element, e.g. in a headword element. Other examples are cancelling bold or italic fonts in an element.

<!ELEMENT light (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

#### B.3.5.11 oblq

Denotes oblique font.

The syntax of the element is shown in the DTD below.

<!ELEMENT oblq (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

#### B.3.5.12 sc

Indicates that the text should be displayed in small capitals.

The syntax of the element is shown in the DTD below.

<!ELEMENT sc (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

## B.3.5.13 ud

Denotes a dot below text. For text comprising more than one letter, the dot should be put under the center of the text. In order to put a dot below each letter, using character entity is recommended for the sake of simplicity.

```
<!ELEMENT ud (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST ud type CDATA #IMPLIED

class CDATA #REQUIRED >
```

[Attributes]
type
(optional)
Example:
(paper-form)
af·fi·z <u>ie</u> r·b <u>a</u> r
<headword>af· fi· z<ud><u>ie</u></ud>r· b<u>a</u>r</headword>
B.3.6 Typesetting-related elements
B.3.6.1 br
Denotes newline.
The syntax of the element is shown in the DTD below.
ELEMENT br EMPTY ATTLIST br %type.attr;
[Attributes]
type
(optional) Specifies the type.
B.3.6.2 nobr
Stipulates a non-breaking space, i.e. the text before and after the element should not be splir onto different lines. One of the typical applications is emoticons.
The syntax of the element is shown in the DTD below.
ELEMENT nobr EMPTY
[Attributes]

None.

<meaning><pos>名</pos> <pos>C</pos> <slabel>コンピュータ</slabel> 顔文字, エモーティコン《電子メールなどで感情表現に用いる;例(右側を下 にして見る) <nobr>:-)</nobr> (笑顔) <nobr>:-(</nobr> (渋 顔)》.</meaning>

# B.3.6.3 ruby-related elements

#### **B.3.6.3.1** General

Ruby related elements are defined as follows.

# B.3.6.3.2 ruby

Denotes ruby.

The syntax of the element is shown in the DTD below.

<!ELEMENT ruby (rb,rt)>

[Attributes]

None.

## B.3.6.3.3 rb

Denotes the text to be annotated by ruby.

The syntax of the element is shown in the DTD below.

<!ELEMENT rb (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

# B.3.6.3.4 rt

Denotes the ruby text.

The syntax of the element is shown in the DTD below.

<!ELEMENT rt (#PCDATA | %inline.html; | %inline.lexml;)\*>

[Attributes]

None.

Example:

(paper-form)

ルビ支字

ルビ<ruby><rb>文字</rb><rt>もじ</rt></ruby>

# B.3.6.4 mlg

Represents a multiline note. (The name is an abbreviation form of "multi line gloss"). Since it is not usually feasible to display a note in multiline manner on digital media, usually it is displayed with the text enclosed within parentheses.

The syntax of the element is shown in the DTD below.

<!ELEMENT mlg (#PCDATA | %inline.html; | %inline.lexml; | mlgbr)\*>

[Attributes]

None.

# **B.3.6.5** mlgbr

Specifies where to split the text in a multiline note. While it is not usually feasible to display multiline as explained in B.3.6.4, this element is usually used to record the layout for the paper form.

The syntax of the element is shown in the DTD below.

<!ELEMENT mlgbr EMPTY>

```
[Attributes]
```

None.

### B.3.7 Other elements

### B.3.7.1 a

Link to external HTML files.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT a (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST a href CDATA #REQUIRED
target CDATA #IMPLIED >
```

[Attributes]

href

Specifies the URL of the link.

target

(optional) Specifies the name of a frame in which the document is opened.

### B.3.7.2 img

Specifies the image file.

The syntax of the element is shown in the DTD below.

[Attributes]

type

(optional) Specifies the type.

src

Specifies the filename of the image.

alt

(optional) Specifies the alternate text.

title

(optional) Specifies the annotation for the image.

mime-type

(optional) Specifies the MIME type.

Attribute value examples: "image/gif", "image/jpeg", "image/png".

## B.3.7.3 gi

Denotes external characters, i.e. characters that cannot be handled using ordinary text data.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT gi EMPTY>
<!ATTLIST gi set CDATA #IMPLIED

name CDATA #REQUIRED

alt CDATA "=">
```

[Attributes]

set

(optional) Specifies the name of the external character set.

name

Specifies the code.

alt

(optional) Specifies the alternate character that is to be used when the external character cannot be handled.

NOTE The default value ("" or U+3013) is to be redefined when necessary according to needs and customs specific to individual languages.

## B.3.7.4 hidden

Specifies text not to be displayed/ignored. While functionally similar to the XML comment (<!--...-->), it is sometimes useful to have the part recognized by an XML parser.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT hidden (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST hidden type CDATA #IMPLIED

memo CDATA #IMPLIED >
```

[Attributes]

type

(optional) Specifies the type.

memo

(optional) Specifies memorandum for editing purposes.

### B.3.7.5 ref

Provides reference to the other items.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT ref (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST ref type CDATA #IMPLIED

refid IDREF #REQUIRED >
```

[Attributes]

refid

Specifies the id or subid attribute value of the referenced element.

type

(optional) Specifies the type.

## B.3.7.6 span

A generic inline element. While this element itself does not serve any semantic purpose, it enables text to be provided with attributes.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT span (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST span %type.attr;>
```

[Attribute	

type

(optional) Specifies the type.

## B.3.7.7 spellout

Fill in the part that was omitted in the headwords/subheadwords. The part is to be displayed in the predetermined manner, e.g. restoring the omitted part or replacing with the text specified by the org attribute.

The syntax of the element is shown in the DTD below.

```
<!ELEMENT spellout (#PCDATA | %inline.html; | %inline.lexml;)*>
<!ATTLIST spellout type CDATA #IMPLIED

org CDATA #REQUIRED >
```

[Attributes]

type

(optional) Specifies the type.

org

(optional) Specifies the alternate text to be displayed instead of the omitted part.

Example:

(paper-form)

thérapist AmE someone whose job is to give patients physical therapy on the instructions of a doctor ([abbrev.] PT) (BrE physiotherapist)

<dic-item id="P0224400#000000" rank="compound">

<head>

<headword><spellout org="&swangacute;">ph&yacute;sical</spellout>
th&eacute;rapist</headword>

<key type="compound">physical therapist</key>

</head>

<meaning><alabel>AmE</alabel>someone whose job is to give patients
physical therapy on the instructions of a doctor ( <pos>abbrev.</pos>PT )
 ( <alabel>BrE</alabel>physiotherapist ) </meaning>
</dic-item>

Example:

(paper-form)

 $\sim$ -ly  $\blacksquare$  天文学的に、けたはずれに;ものすごく  $\parallel$  The car is  $\sim$  expensive. その車はけたはずれに高い

<subhead subid="ABC1234500#00010" type="派生">
<subheadword type="派生"><subheadword type="派生"><subheadword type="派生"><ssebendary = "><subheadword = "><spellout>・ly</subheadword>
<meaning><pos>副</pos>天文学的に、けたはずれに;ものすごく</meaning>

<example>The car is <spellout org="~">astronomically</spellout>
expensive. | その車はけたはずれに高い</example>
</subhead>

(digital representation, replacing the tildes)

**as·tro·nom·i·cal·ly 副** 天文学的に、けたはずれに;ものすごく || The car is *astronomically* expensive. その車はけたはずれに高い

### B.3.7.8 url

Denotes internet URL and related information.

The syntax of the element is shown in the DTD below.

<!ELEMENT url (#PCDATA | %inline.html; | %inline.lexml;)\*>
<!ATTLIST url type CDATA #IMPLIED >

[Attributes]

type

(optional) Specifies the type.

## B.3.7.9 xref

Provides the reference to another item. Similar to the ref elements, but this element is for temporary use such as when the reference is incomplete because it is not resolved or for other reasons.

The syntax of the element is shown in the DTD below.

(optional) Specifies the type.

type

# B.4 Specification of the LeXML format in the DTD syntax

```

# British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

#### About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards -based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

### Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at bsigroup.com/standards or contacting our Customer Services team or Knowledge Centre.

## **Buying standards**

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at bsigroup.com/shop, where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

## Copyright in BSI publications

All the content in BSI publications, including British Standards, is the property of and copyrighted by BSI or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use.

Save for the provisions below, you may not transfer, share or disseminate any portion of the standard to any other person. You may not adapt, distribute, commercially exploit, or publicly display the standard or any portion thereof in any manner whatsoever without BSI's prior written consent.

### Storing and using standards

Standards purchased in soft copy format:

- A British Standard purchased in soft copy format is licensed to a sole named user for personal or internal company use only.
- The standard may be stored on more than 1 device provided that it is accessible
  by the sole named user only and that only 1 copy is accessed at any one time.
- A single paper copy may be printed for personal or internal company use only.

Standards purchased in hard copy format:

- A British Standard purchased in hard copy format is for personal or internal company use only.
- It may not be further reproduced in any format to create an additional copy.
   This includes scanning of the document.

If you need more than 1 copy of the document, or if you wish to share the document on an internal network, you can save money by choosing a subscription product (see 'Subscriptions').

## **Reproducing extracts**

For permission to reproduce content from BSI publications contact the BSI Copyright & Licensing team.

### **Subscriptions**

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to bsigroup.com/subscriptions.

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

**PLUS** is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit bsigroup.com/shop.

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email subscriptions@bsigroup.com.

### Revisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.
