Disc springs

Part 1: Calculation

BS ISO 19690-1:2017

National foreword

This British Standard is the UK implementation of ISO 19690-1:2017.

The UK participation in its preparation was entrusted to Technical Committee FME/9/3, Springs.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 227, Springs.

A list of all the parts in the ISO 19690 series can be found on the ISO website.

Disc springs —

Part 1: Calculation

1 Scope

This document specifies design criteria and features of disc springs, whether as single disc springs or as stacks of disc springs. It includes the definition of relevant concepts, as well as design formulae, and covers the fatigue life of such springs.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 16249, Springs — Symbols
ISO 26909, Springs — Vocabulary

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 26909 apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <u>www.iso.org/obp</u>
- IEC Electropedia: available at <u>www.electropedia.org</u>

4 Symbols and units

For the purposes of this document, the symbols and units given in ISO 16249 and <u>Table 1</u> apply.

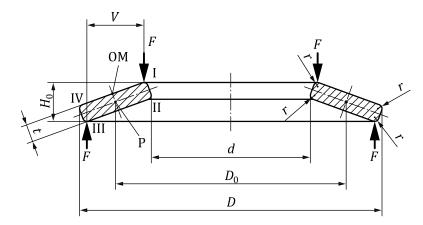

Table 1 — Symbols and units for design calculation

Table 3 shows the dimensional series.

Table 3 — Dimensional series

Dimensional series	h_0/t	$t_{ m f}/t$	D/t
A	approximately 0,40	approximately 0,94	approximately 18
В	approximately 0,75	approximately 0,94	approximately 28
С	approximately 1,30	approximately 0,96	approximately 40

6 Design formulae for springs

6.1 General

The following formulae apply to single disc springs with or without flat bearings, where 16 < D/t < 40 and 1.8 < D/d < 2.5. In the case of other designs or materials, it is recommended that the spring manufacturer should be consulted.

6.2 Test load

The test load of single disc springs, F_t , is designed for a deflection $s = 0.75 \ h_0$. Single disc springs with flat bearings shall have the same test load for a test height, H_t , as ones without, where the principal dimensions D, d and H_0 are the same. Flat bearings have the effect of reducing the length of the lever arm. The increased load which results can be compensated by reducing the thickness of the disc spring. The load/deflection curve of such springs deviates from those without flat bearings, with the exception of the point at which the curves intersect.

6.3 Coefficients used in calculation

Coefficients can be given by Formula (1) to Formula (7):

$$\alpha = \frac{D}{d} \tag{1}$$

$$C_{1} = \frac{1}{\pi} \times \frac{\left(\frac{\alpha - 1}{\alpha}\right)^{2}}{\frac{\alpha + 1}{\alpha - 1} - \frac{2}{\ln \alpha}}$$
(2)

$$C_2 = \frac{1}{\pi} \times \frac{6}{\ln \alpha} \times \left(\frac{\alpha - 1}{\ln \alpha} - 1\right)$$
(3)

$$C_3 = \frac{3}{\pi} \times \frac{\alpha - 1}{\ln \alpha} \tag{4}$$

$$C_4 = \sqrt{-\frac{k_1}{2} + \sqrt{\left(\frac{k_1}{2}\right)^2 + k_2}} \tag{5}$$

where

$$k_{1} = \frac{\left(\frac{t_{f}}{t}\right)^{2}}{\left(\frac{1}{4} \times \frac{H_{0}}{t} - \frac{t_{f}}{t} + \frac{3}{4}\right)\left(\frac{5}{8} \times \frac{H_{0}}{t} - \frac{t_{f}}{t} + \frac{3}{8}\right)}$$
(6)

$$k_{2} = \frac{k_{1}}{\left(\frac{t_{f}}{t}\right)^{3}} \left[\frac{5}{32} \left(\frac{H_{0}}{t} - 1\right)^{2} + 1 \right]$$
 (7)

In the case of springs without flat bearings, $C_4 = 1$.

In the case of springs with flat bearings, C_4 shall be calculated using Formula (5) and, in all subsequent formulae, t_f shall be substituted for t and $h_{0,f}$ (i.e. $H_0 - t_f$) for h_0 .

Guideline values for the reduction in disc spring thickness as a function of the dimensional series are given in Table 3.

6.4 Spring load

The load can be calculated using Formula (8). In the case of springs without flat bearings, $C_4 = 1$.

$$F = \frac{4E}{1 - v^2} \times \frac{t^4}{C_1 \times D^2} \times C_4^2 \times \frac{s}{t} \times \left[C_4^2 \times \left(\frac{h_0}{t} - \frac{s}{t} \right) \times \left(\frac{h_0}{t} - \frac{s}{2t} \right) + 1 \right]$$
 (8)

In the case of springs where there is consideration of chamfer radius at edge, and without flat bearings, the load can be calculated using Formula (9):

$$F = \frac{D - d}{(D - d) - 3r} \times \frac{4E}{1 - v^2} \times \frac{t^3}{C_1 \times D^2} \times s \times \left[\left(\frac{h_0}{t} - \frac{s}{t} \right) \times \left(\frac{h_0}{t} - \frac{s}{2t} \right) + 1 \right]$$

$$\tag{9}$$

6.5 Design stresses

The design stresses can be calculated using <u>Formula (10)</u> to <u>Formula (14)</u>. Positive stresses are tensile stresses and negative stresses are compressive stresses.

$$\sigma_{\rm OM} = -\frac{4E}{1 - v^2} \times \frac{t}{C_1 \times D^2} \times C_4 \times s \times \frac{3}{\pi}$$
 (10)

$$\sigma_{\rm I} = \frac{4E}{1 - v^2} \times \frac{t}{C_1 \times D^2} \times C_4 \times s \times \left[-C_4 \times C_2 \times \left(\frac{h_0}{t} - \frac{s}{2t} \right) - C_3 \right]$$
(11)

$$\sigma_{\text{II}} = \frac{4E}{1 - v^2} \times \frac{t}{C_1 \times D^2} \times C_4 \times s \times \left[-C_4 \times C_2 \times \left(\frac{h_0}{t} - \frac{s}{2t} \right) + C_3 \right]$$
 (12)

$$\sigma_{\text{III}} = \frac{4E}{1 - v^2} \times \frac{t}{\alpha \times C_1 \times D^2} \times C_4 \times s \times \left[C_4 \times (2C_3 - C_2) \times \left(\frac{h_0}{t} - \frac{s}{2t} \right) + C_3 \right]$$
 (13)

$$\sigma_{\text{IV}} = \frac{4E}{1 - v^2} \times \frac{t}{\alpha \times C_1 \times D^2} \times C_4 \times s \times \left[C_4 \times (2C_3 - C_2) \times \left(\frac{h_0}{t} - \frac{s}{2t} \right) - C_3 \right]$$
 (14)

6.6 Spring rate

The spring rate, which is not linear, can be calculated using <u>Formula (15)</u> by differentiating <u>Formula (8)</u> with respect to the deflection, *s.*

$$R = \frac{dF}{ds} = \frac{4E}{1 - v^2} \times \frac{t^3}{C_1 \times D^2} \times C_4^2 \times \left\{ C_4^2 \times \left[\left(\frac{h_0}{t} \right)^2 - 3\frac{h_0}{t} \times \frac{s}{t} + \frac{3}{2} \left(\frac{s}{t} \right)^2 \right] + 1 \right\}$$
 (15)

In the case of springs where there is consideration of chamfer radius at edge, the spring rate can be calculated using Formula (16):

$$R = \frac{dF}{ds} = \frac{D - d}{(D - d) - 3r} \times \frac{4E}{1 - v^2} \times \frac{t^3}{C_1 \times D^2} \times \left[\left(\frac{h_0}{t} \right)^2 - 3\frac{h_0}{t} \times \frac{s}{t} + \frac{3}{2} \left(\frac{s}{t} \right)^2 + 1 \right]$$
 (16)

6.7 Energy capacity of springs

The energy capacity of springs can be calculated using Formula (17):

$$W = \int_{0}^{s} F \times ds = \frac{2E}{1 - v^{2}} \times \frac{t^{5}}{C_{1} \times D^{2}} \times C_{4}^{2} \times \left(\frac{s}{t}\right)^{2} \times \left[C_{4}^{2} \times \left(\frac{h_{0}}{t} - \frac{s}{2t}\right)^{2} + 1\right]$$
(17)

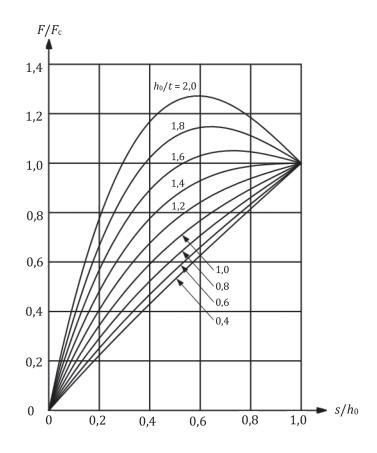

7 Load characteristics

7.1 Load characteristics for a single disc spring

7.1.1 Load/deflection curve

The load/deflection curve for a single disc spring is not linear, with its shape being rather a function of the ratio h_0/t .

Figure 2 illustrates load/deflection curves as a function of the ratio h_0/t or $C_4 \times h_{0,f}/t_f$.

 F/F_c spring load ratio

 h_0/t ratio of initial cone height of spring to thickness

 s/h_0 deflection ratio

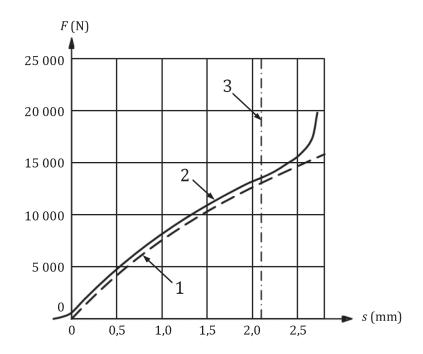

NOTE In the case of springs with flat bearings, $C_4 \times h_{0,f}/t_f$ is substituted for h_0/t .

Figure 2 — Spring load/deflection curves for various h_0/t ratios

7.1.2 Design and actual load characteristics

When measuring the spring load using a load tester, the spring load is, for example, as shown in Figure 3.

When $s/h_0 > 0.75$, the actual curve will deviate more and more from the design curve because the disc springs will be in contact with each other or with the support plate, which results in a steady reduction in the length of the lever arm.

- 1 design curve
- 2 actual curve
- 3 $s = 0.75 h_0$ (h_0 is the initial cone height of springs without flat bearings)
- F spring load
- s deflection of spring

Figure 3 — Example of actual and design spring load/deflection curves

7.2 Load characteristics for stacks of disc springs

7.2.1 General

For springs, various load characteristics can be obtained from the various combinations. When the spring is used in a stack and applied to a load, it should be guided by an inner guide or an outer guide to keep it in position. It is preferable to use an inner guide, but an outer guide is acceptable. When using the guide, a clearance between the spring and the guide shall be made. The amount of clearance should be agreed between customer and supplier.

In the case of springs stacked in series, where $h_0/t > \approx 1,25$, it may be assumed that the deflection of the single disc springs will not be uniform, which may cause a failure.

7.2.2 Stacking in parallel

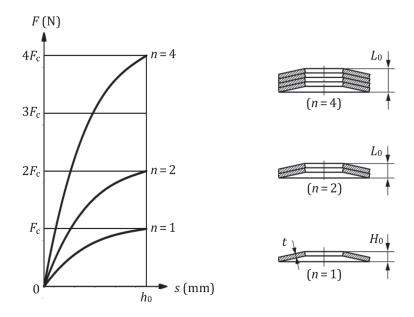

In the case of stacking disc springs in parallel as shown in <u>Figure 4</u>, the spring load will be in direct proportion to the number of single disc springs making up the stack. The spring load, the deflection and free height are calculated using <u>Formula (18)</u> to <u>Formula (20)</u>:

$$F_{G} = n \times F \tag{18}$$

$$s_{G} = s \tag{19}$$

$$L_0 = H_0 + (n-1) \times t \tag{20}$$

NOTE In the case of springs with flat bearings, t_f is substituted for t.

Key

- F spring load
- F_c design spring load when spring is in the flattened position
- H_0 free height of spring
- h_0 initial cone height of springs without flat bearings
- L_0 free height at the time of combining springs
- *n* number of springs piled in parallel
- s deflection of spring
- t thickness of spring

Figure 4 — Variations in load/deflection curves when stacking springs in parallel

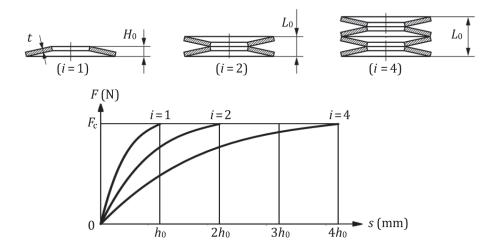

7.2.3 Stacking in series

In the case of stacking disc springs in series, as shown in <u>Figure 5</u>, the deflection will be in direct proportion to the number of single disc springs making up the stack. The spring load, the deflection and free height are calculated using <u>Formula (21)</u> to <u>Formula (23)</u>:

$$F_{\mathsf{G}} = F \tag{21}$$

$$S_{G} = i \times S \tag{22}$$

$$L_0 = i \times H_0 \tag{23}$$

F spring load

 F_c design spring load when spring is in the flattened position

 H_0 free height of spring

 h_0 initial cone height of springs without flat bearings

i number of springs combined in series

 L_0 free height at the time of combining springs

s deflection of spring

t thickness of spring

Figure 5 — Variations in load/deflection curves when stacking springs in series

7.2.4 Stacking in parallel and series

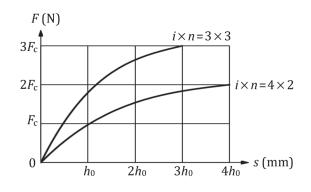

In the case of stacking disc springs in parallel and series, as shown in <u>Figure 6</u>, the spring load, the deflection and free height are calculated using <u>Formula (24)</u> to <u>Formula (26)</u>:

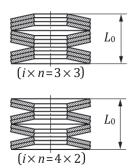

$$F_{G} = n \times F \tag{24}$$

$$S_{G} = i \times S \tag{25}$$

$$L_0 = [H_0 + (n-1) \times t] \times i \tag{26}$$

NOTE In the case of springs with flat bearings, t_f is substituted for t.

- F spring load
- $F_{\rm c}$ design spring load when spring is in the flattened position
- h_0 initial cone height of springs without flat bearings
- i number of springs combined in series
- L_0 free height at the time of combining springs
- *n* number of springs piled in parallel
- s deflection of spring

Figure 6 — Variations in load/deflection curves when stacking springs in parallel and series

8 Design stresses

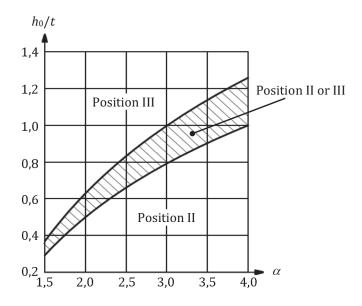

Since there are residual stresses in the spring as a result of the manufacturing process used, the results obtained from <u>Formula (10)</u> to <u>Formula (14)</u> do not reflect the actual values involved, but rather any nominal values. Thus, all information relating to stress in this document represents these nominal values.

An estimate of the permissible free overall height of the spring, H_0 , may be based on a determination of the design stress, σ_{OM} , which should be about equal to the tensile strength.

The most important parameter for springs subjected to fatigue loading is the calculated tensile stress on the lower side of a single disc spring. The position most vulnerable to fatigue failure will be either the lower inner edge, position II, or the lower outer edge, position III (see Figure 1 and Figure 7), depending on the ratios $D/d = \alpha$, h_0/t and s/h_0 .

This is illustrated in Figure 7 and applies to springs with or without flat bearings.

Since the ratio s/h_0 is a factor of influence with regard to the level of tensile stress at positions II and III, it is recommended, for the area between these positions, that σ_{II} and σ_{III} be determined in accordance with the formulae given in <u>6.5</u>.

 h_0/t ratio of initial cone height of spring to thickness

 α ratio of external diameter to internal diameter, $\alpha = D/d$

NOTE In the case of springs with flat bearings, $C_4 \times h_{0,f}/t_f$ is substituted for h_0/t .

Figure 7 — Relevant positions of loading for springs subject to fatigue loading

9 Types of loading

9.1 Static loading and moderate fatigue conditions

Springs shall be deemed to be subject to static loading

- a) where this is the only type of loading and where it does not change, and
- b) if they are deemed to be subject to moderate fatigue conditions where the loading does change, but only infrequently, and where the number of cycles to which they are exposed during their intended use is less than 10⁴.

9.2 Dynamic loading

Depending on the required minimum number of loading cycles without failure, N, a differentiation is made between

- a) springs with a limited fatigue life, i.e. those which are able to withstand $10^4 \le N < 2 \times 10^6$ cycles, and
- b) springs with a high fatigue life, i.e. those which are able to withstand 2×10^6 cycles or more without failure.

Where springs are expected to withstand substantially more than 2×10^6 cycles, the manufacturer shall be consulted.

British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards -based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at bsigroup.com/standards or contacting our Customer Services team or Knowledge Centre.

Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at bsigroup.com/shop, where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

Copyright in BSI publications

All the content in BSI publications, including British Standards, is the property of and copyrighted by BSI or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use.

Save for the provisions below, you may not transfer, share or disseminate any portion of the standard to any other person. You may not adapt, distribute, commercially exploit, or publicly display the standard or any portion thereof in any manner whatsoever without BSI's prior written consent.

Storing and using standards

Standards purchased in soft copy format:

- A British Standard purchased in soft copy format is licensed to a sole named user for personal or internal company use only.
- The standard may be stored on more than 1 device provided that it is accessible
 by the sole named user only and that only 1 copy is accessed at any one time.
- A single paper copy may be printed for personal or internal company use only.

Standards purchased in hard copy format:

- A British Standard purchased in hard copy format is for personal or internal company use only.
- It may not be further reproduced in any format to create an additional copy.
 This includes scanning of the document.

If you need more than 1 copy of the document, or if you wish to share the document on an internal network, you can save money by choosing a subscription product (see 'Subscriptions').

Reproducing extracts

For permission to reproduce content from BSI publications contact the BSI Copyright & Licensing team.

Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to bsigroup.com/subscriptions.

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

PLUS is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit bsigroup.com/shop.

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email subscriptions@bsigroup.com.

Revisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.
