Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 24101-2 was prepared by Technical Committee ISO/TC 204, *Intelligent transport systems*.

ISO 24101 consists of the following parts, under the general title *Intelligent transport systems — Communications access for land mobiles (CALM) — Application management*:

- *Part 1: General requirements*
- *Part 2: Conformance test*

Introduction

This part of ISO 24101 is part of a family of International Standards for communications access for land mobiles (CALM) which determine a common architecture, network protocols and air interface definitions for wireless communications using cellular second generation, cellular third generation, 5 GHz, millimeter, and infrared communications. Other air interfaces can be added at a later date. Air interfaces included in the CALM International Standards provide facilities for broadcast, point-to-point, vehicle-to-vehicle, and vehicle-to-point communications in the intelligent transport systems (ITS) sector.

The application management (AM), as defined in ISO 24101-1:2008, is the function to install, uninstall and modify the ITS applications in a reliable and secure manner, and it addresses the following requirements:

- a) installation of applications on CALM equipment after the equipment has been deployed;
- b) updating of applications, including uninstalling, on on-board equipment (OBE) as well as wireless access equipment (WAE) after the equipment has been deployed;
- c) providing a standardized interface and functionality so that application developers and system operators can successfully perform the functions in a) and b).

The purpose of this part of ISO 24101 is to specify a standardized conformance test for the AM, which verifies that the function of the developed AM complies with the requirements specified in ISO 24101-1:2008. See Figure 1.

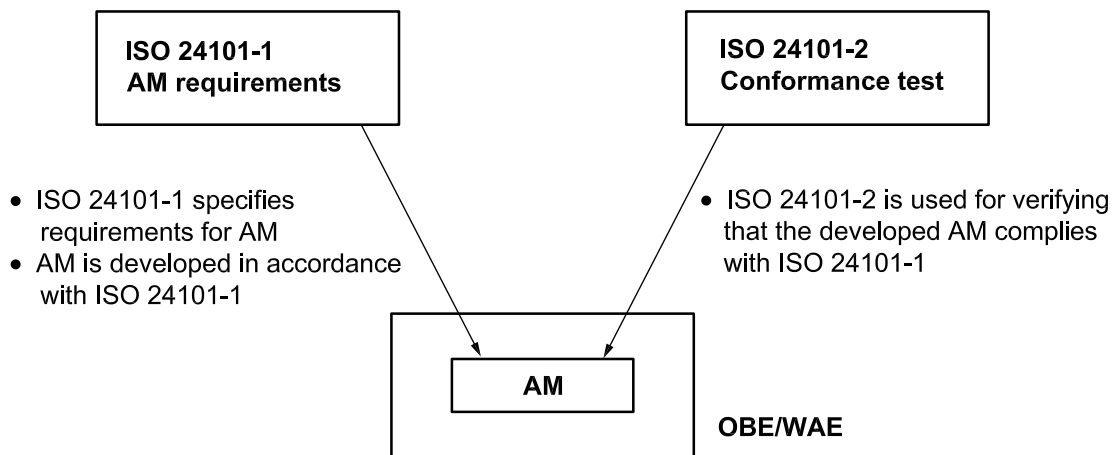

Figure 1

Intelligent transport systems — Communications access for land mobiles (CALM) — Application management —

Part 2: Conformance test

1 Scope

This part of ISO 24101 specifies the test system, test cases, test conditions, test procedures and test results for examining the function of the communications access for land mobiles (CALM) application management (AM).

NOTE Accreditation and certification are outside the scope of this part of ISO 24101.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 24101-1:2008, *Intelligent transport systems — Communications access for land mobiles (CALM) — Application management — Part 1: General requirements*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

communication station

wireless station that communicates with the equipment under test (EUT) by using the communications access for land mobiles (CALM) medium for the application management (AM) conformance test

3.2

normal operation

coincidence of the test results and the predetermined states, which are defined before the test, when the test application is executed on the equipment under test (EUT)

3.3

test applications

applications that are used for installing, uninstalling or modifying an application and are pre-installed in the equipment under test (EUT) or the test installer for the application management (AM) conformance test

3.4

test installer

installer that is used for the application management (AM) conformance test

- 3.5**
test operator
operator who operates the test installer for the application management (AM) conformance test
- 3.6**
verification means
means that verifies the results of the application management (AM) conformance test and sets the equipment under test (EUT) to the state defined by the test procedures

4 Abbreviated terms

For the purposes of this document, the following abbreviated terms apply.

AM	Application Management
AME	Application Management Entity
AMT	Application Management Table
API	Application Programming Interface
BER	Bit Error Rate
CALM	Communications Access for Land Mobiles
CPU	Central Processing Unit
ETSI	European Telecommunications Standards Institute
EUT	Equipment Under Test (ISO/IEC 9646-1:1994)
ICS	Implementation Conformance Statement (ISO/IEC 9646-1:1994)
ITS	Intelligent Transport Systems
ITU-T	International Telecommunication Union – Telecommunication Standardization Sector
IUT	Implementation Under Test (ISO/IEC 9646-1:1994)
IXIT	Implementation eXtra Information for Testing (ISO/IEC 9646-1:1994)
OBE	On-Board Equipment
OS	Operating System
PER	Packet Error Rate
RSSI	Received signal strength indication
TS	Test System
TTCN-3	Testing and Test Control Notation Version 3
URL	Uniform Resource Locator
VM	Virtual Machine
WAE	Wireless Access Equipment

5 General

The methodology and concepts of the AM conformance test are based on ISO/IEC 9646-1:1994.

An AM is developed firstly by the service provider in accordance with ISO 24101-1:2008. The developed AM is software and is installed in the equipment under test (EUT), i.e. on-board equipment (OBE) or wireless access equipment (WAE), prior to the AM conformance test.

Figure 2 shows the basic approach to the AM conformance test.

Figure 2 — Basic approach to conformance test

The basic approach is as follows:

- a) collect requirements and specifications for the EUT;
- b) prepare implementation conformance statement(s) (ICS) and implementation eXtra information for testing [IXIT(s)];
- c) prepare some test applications;
- d) prepare test suites, i.e. the set of basic tests and advanced tests, and test system including the verification means, etc.;
- e) install the AM in the EUT, and install the test applications in the EUT and the test installer;
- f) perform the conformance test;
 - 1) download and install the test application into the EUT for installation or modification,
 - 2) execute the test application,
 - 3) confirm the results of the execution by the verification means, and compare the results with the predetermined states, i.e. expected states;
 - i) when all results coincide with the predetermined states: verdict is set into pass,
 - ii) if there are one or more differences: verdict is set into fail;
 - 4) send the command of uninstallation to the EUT and confirm the results of the execution by reading the contents of the application management table (AMT) by the verification means, and
- g) analyse results and prepare the conformance test report.

Figure 3 shows the conformance test process.

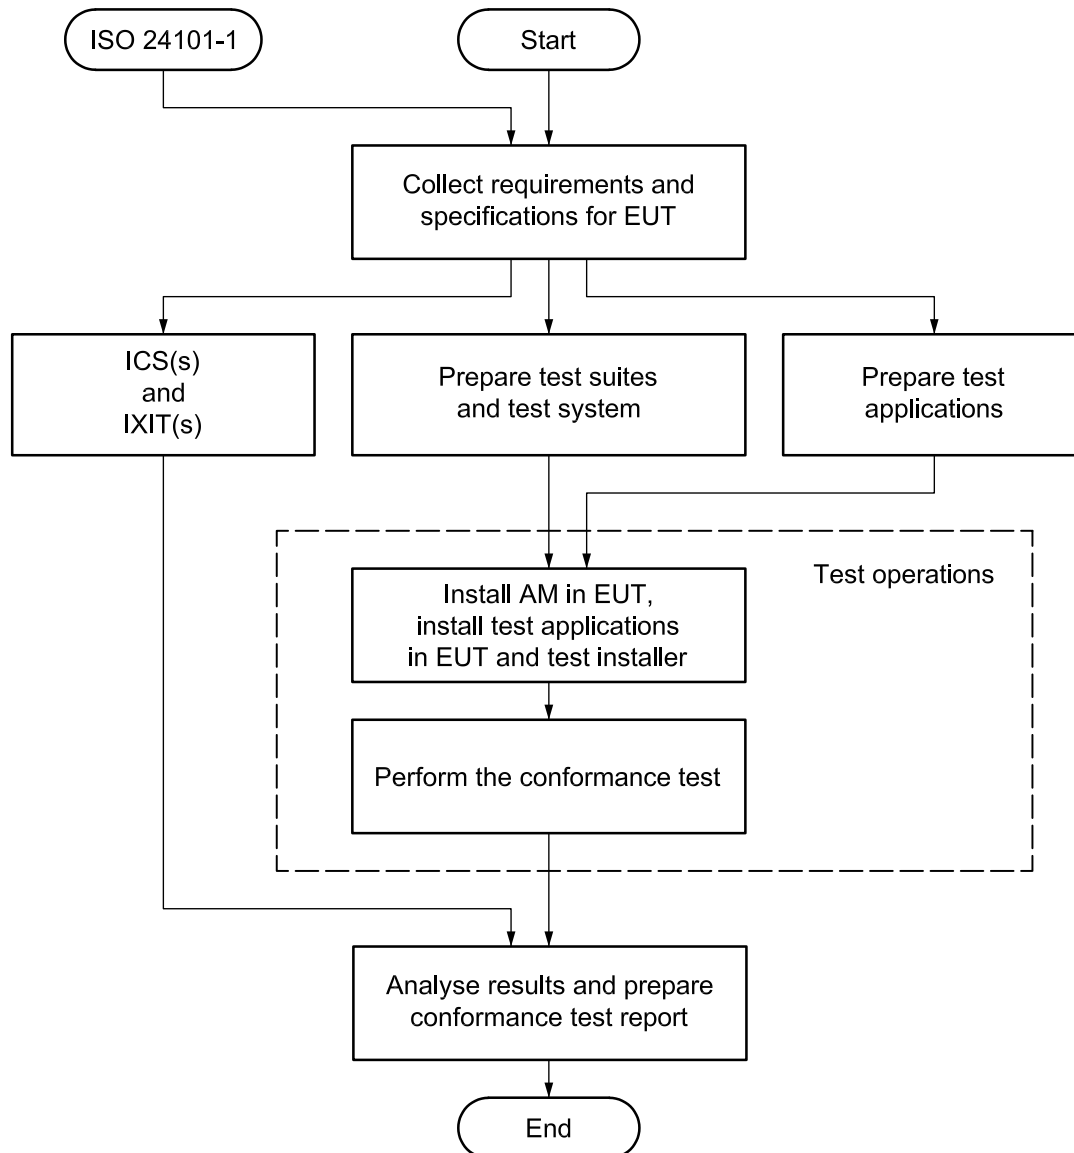

Figure 3 — Conformance test process

6 Test system

Figure 4 shows the test system for the AM conformance test.

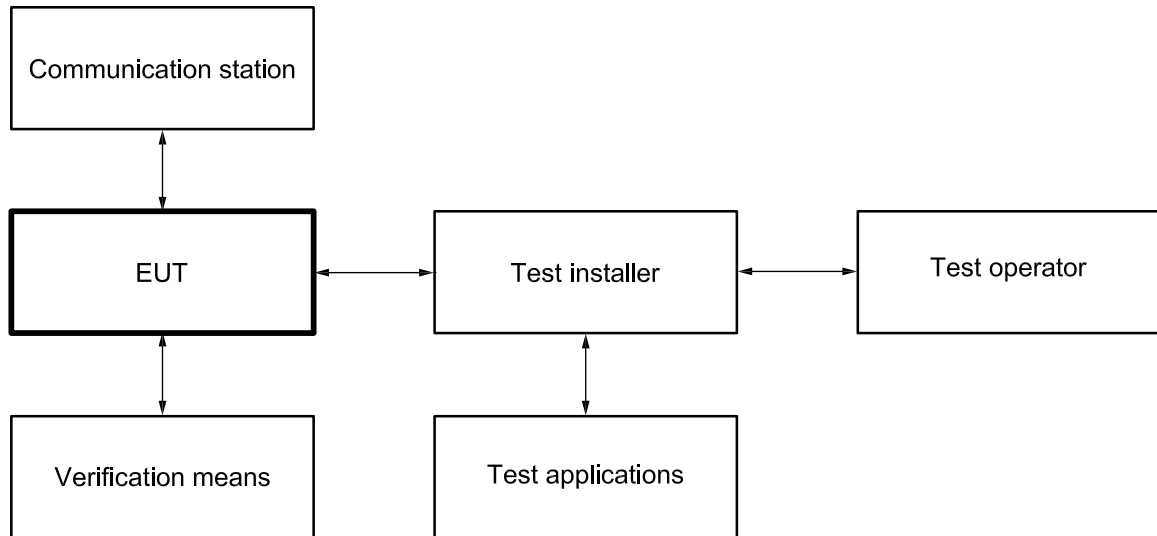

Figure 4 — Test system

7 Functionality of entities

7.1 Test applications

Test applications are pre-installed in the test installer for installation or modification of applications, and also in the EUT for uninstallation. See 9.1 and 9.5.

7.2 Test operator

The test operator installs, uninstalls or modifies the test applications via the test installer, and verifies the test results by the verification means.

7.3 Test installer

7.3.1 OBE/WAE initiated download case

The test installer can be a test server in case of the OBE/WAE initiated download. See ISO 24101-1:2008.

External human machine interfaces (e.g. keyboard and display) may be temporarily connected to the EUT via its external interface (if necessary for the purpose of the AM conformance test) for providing the following operator's human machine interfaces:

- a) inputting commands to the EUT for installation, uninstallation or modification of an application;
- b) display of the command execution results.

EXAMPLE "Under command execution", "The command has successfully completed", "Operator authentication error" and "Manager certificate error" are examples of the display.

7.3.2 Installer initiated download case

In case of installer initiated download, the test installer has the functions specified in 7.3.1 inside.

7.4 Verification means

The verification means has the following functions:

- a) confirming the execution results of the installed or modified application in cooperation with the communication station (e.g. the communication results with the communication station is displayed on the verification means);
- b) reading and confirming the AMT information of the EUT;
- c) rewriting the AMT information for intentional error;
- d) setting the clock data of the EUT for the scheduled update (T-10 in Table 1);
- e) setting the test conditions in the EUT (optional, e.g. halt under program execution).

NOTE The verification means can use a debugger, an emulator or a personal computer, etc. For example, a debugger has useful functions such as the break point function and the contents rewriting function of a specified program address. Also, in a simple case, the verification means can be a test installer (e.g. use of the AMT reading function).

7.5 Communication station

The communication station is used for verifying that applications in the EUT operate normally after installation or modification of an application in cooperation with the verification means. The verification includes wireless communication with CALM media.

7.6 Connection between entities

The connection methods between entities are not specified in this part of ISO 24101.

8 Test cases

8.1 General

Test cases are subdivided into basic tests and advanced tests.

The basic tests verify the basic operations of the AM, and the advanced tests verify that the AM can detect abnormality when the test system is set intentionally in abnormal state.

8.2 Basic tests

Table 1 specifies the test cases of basic tests.

Table 1 — Basic tests

Test number	Test name
T-1	Installation of application
T-2	Modification of application
T-3	Uninstallation of application
T-4	Function of reading application
T-5	Installation of common file
T-6	Modification of common file
T-7	Uninstallation of common file
T-8	Function of reading common file
T-9	Function of reading AMT information
T-10	Function of the scheduled update

The function of each test name is given in ISO 24101-1:2008.

8.3 Advanced tests

Table 2 specifies the test cases of advanced tests.

Table 2 — Advanced tests

Test number	Test name
T-11	Operator authentication
T-12	Manager certificate
T-13	The same file name
T-14	Lack of sufficient available memory space
T-15	Prohibition of application management entity (AME) start while an application is running
T-16	Prohibition of application start while AME is running
T-17	Abnormal termination of download
T-18	Archival records
T-19	Restoration function

The function of each test name is given in ISO 24101-1:2008.

9 Test conditions

9.1 Test applications

Test applications shall have the following functions:

- a) communicate with the CALM compliant communication station [*CALM compliant*];
- b) meaning of normal operation is defined beforehand and the test applications are programmed according to the definitions [*Definitions in advance*];

- c) decision criteria of the test results are explicit [*Unambiguity*];
- d) test applications are programmed so that the test results can be confirmed by communication with the communication station and the verification means [*Testability*].

Test applications and verification means should co-operate with each other. Test applications should be programmed to output or display the communication result with the communication station and the state of the EUT to the verification means so that the test operator can confirm the test results by the verification means.

At least two applications with different manager certificates should be installed in the EUT for modification or uninstallation, and at least two applications should be installed in the test installer for installation or modification before the AM conformance test. See Table 3.

9.2 Common files

At least two common files should be installed in the EUT for modification or uninstallation, and at least two common files should be installed in the test installer for installation or modification before the AM conformance test. See Table 3.

9.3 Security information for operator authentication

Security information (e.g. public key) that allows the test installer to authenticate a test operator is stored in the test installer in advance. Mutual authentication of the test operator and test installer shall precede any exchange of application information. See ISO 24101-1:2008, 8.3.1.

The details of operator authentication are not specified in this part of ISO 24101.

9.4 Manager certificate for access control

Manager certificate is a manager's security credential containing information used to verify the identity of the source of the credential. For example a manager certificate is sent by the manager of an application to the OBE/WAE and is used by the AME to authenticate the manager. See ISO 24101-1:2008, 8.3.2.

At least six manager certificates may be set corresponding to the test applications and common files. See Table 3.

9.5 Combination example of test conditions

Table 3 shows the kind of test applications and common files that are required for the conformance test, and also shows the combination example of pre-installation place, manager certificate and test purpose for each kind.

Table 3 — Combination example of test conditions

Test application or common file	Pre-installation place	Manager certificate	Test purpose
testApplication-a	Installer	managerCertificate-a	Installation
testApplication-b1	EUT	managerCertificate-b	Modification
testApplication-b2	Installer	managerCertificate-b	Modification
testApplication-c	EUT	managerCertificate-c	Uninstallation
commonFile-a	Installer	managerCertificate-d	Installation
commonFile-b1	EUT	managerCertificate-e	Modification
commonFile-b2	Installer	managerCertificate-e	Modification
commonFile-c	EUT	managerCertificate-f	Uninstallation

NOTE 1 The file names are shown as testApplication-a, -b, -c, etc. The number following it shows a version number.

NOTE 2 The file names are representatively shown as testApplication-a, etc. The naming method of file names (i.e. identification of the application program) is specified in ISO 24101-1:2008, 8.1, although the file names of test applications can be named by the arbitrary method distinguished mutually if the test applications are test purpose only and they are not installed in the OBE/WAE products. This is applicable also to common files.

Figure 5 shows the test purposes and corresponding pre-installations for test applications (testApplications) and common files (commonFiles).

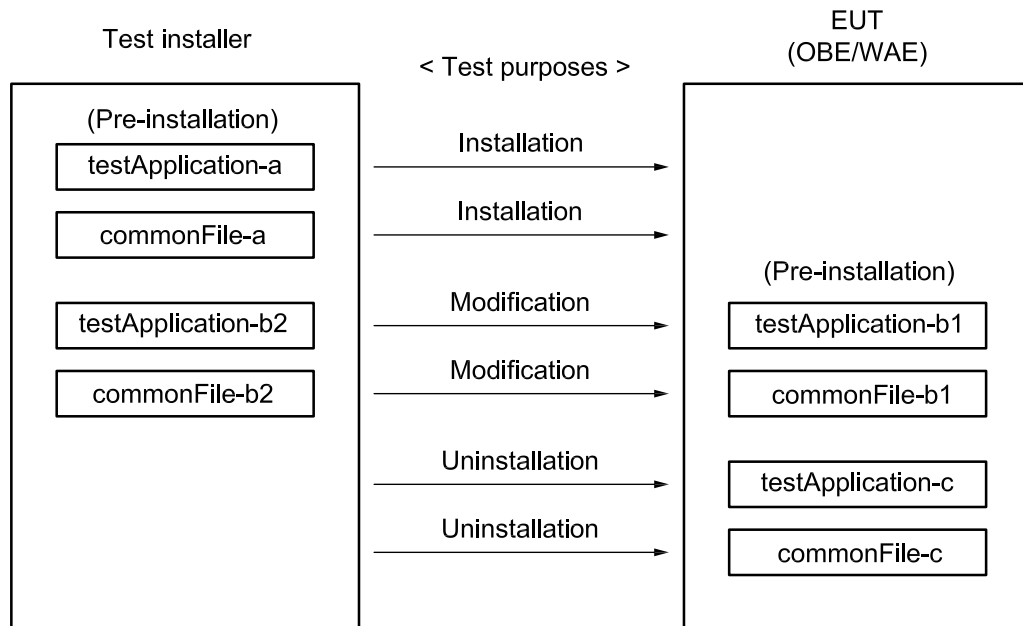

Figure 5 — Test purposes and pre-installations

10 Test procedures

10.1 Basic tests

Annex A specifies the test procedures for each test case of the basic tests.

10.2 Advanced tests

Annex B specifies the test procedures for each test case of the advanced tests.

10.3 Notation for test procedures

Test procedures are specified in TTCN-3 in Annex A and Annex B. See ITU-T Recommendations Z.161 through to Z.167 and ETSI ES 201 873-1 about TTCN-3.

In TTCN-3, a message is transferred between TS and EUT via a port, i.e. a message is sent to EUT via a port from TS, and TS receives the response message from EUT via the port. The response message is compared with the expected message and verdict is set according to the comparison result. On the other hand, a debugger may be used, for example as the verification means as shown in 7.4 in the implementation. In such a case, from a viewpoint of TTCN-3, it is considered that the connector which connects the debugger to EUT corresponds to the port and it is abstracted that a message is transferred via the port.

10.4 Commands in test procedures

Annex C specifies the commands that can be used for installation, uninstallation and modification in the test procedures of Annex A and Annex B.

11 Test results

Annex A also specifies the test results as the verdict in test procedures for each test case of the basic tests.

Annex B also specifies the test results as the verdict in test procedures for each test case of the advanced tests.

12 Test documentation

12.1 Implementation conformance statement (ICS)

The implementation conformance statement (ICS) is a statement made by the supplier that claims conformance to a certain specification. The ICS states which capabilities have been implemented in the specifications. The ICS also states possible limitations in the implementation of the specification.

This part of ISO 24101 describes testing of implementations according to ISO 24101-1:2008.

Annex D contains the ICS proforma that shall be used for the ICS.

12.2 Implementation eXtra information for testing (IXIT)

The implementation eXtra information for testing (IXIT) is a statement made by the supplier or an implementor of an implementation under test (IUT) which contains or references all of the information, in addition to that given in the ICS, related to the IUT and its testing environment. IXIT enables a test laboratory or a test organization to run an appropriate test suite against the IUT.

The IXIT shall also contain further information and procedures that are not specified in ISO 24101-1:2008 but are pre-requisites to perform the test.

Annex E contains the IXIT proforma that shall be used for the declaration of the IXIT.

12.3 Test report

Each test carried out shall be documented. For each test a pass or fail verdict shall be given. The results of all tests shall form the conformance test report.

Annex A (normative)

Basic tests

A.1 Installation of application

Table A.1 — Test number T-1

<p>Test name Installation of application</p>

    [] alt_timeGuard ( t_installer ) ;
  }
}
}

```

NOTE The new application program shall contain the scheduled time and date information. The application program will be activated after the scheduled time and date and until then it remains inactive.

Annex B (normative)

Advanced tests

B.1 Operator authentication

Table B.1 — Test number T-11

Test name Operator authentication
Purpose Verifying that the test installer does not authenticate the test operator when the test operator inputs wrong security information for operator authentication to the test installer
Test conditions See Clause 9.
Test procedures <pre>module TestCase11 { type port Operator message { out a_command ; in a_response ; } type component TSSState2 { template charstring a_command := "?????" ; // Wrong security information for operator authentication template charstring a_response := "Operator authentication error" ; timer t_operator ; port Operator pt_operator ; } testcase tc_t11 () runs on TSSState2 { pt_operator.send (a_command) ; t_operator.start(300.0) ; alt { [] pt_operator.receive(a_response) ; t_operator.stop ; setverdict(pass) ; } [] pt_operator.receive { t_operator.stop ; setverdict(fail) ; } [] t_operator.timeout { setverdict(fail) ; } } } }</pre>
NOTE In this test case, the test installer corresponds to EUT and the test operator corresponds to the test system, respectively.

B.2 Manager certificate

Table B.2 — Test number T-12

<p>Test name</p> <p>Manager certificate</p>
<p>Purpose</p> <p>Verifying that the access is denied when the test operator sends the command of installing, uninstalling or modifying application by wrong manager certificate</p>
<p>Test conditions</p> <p>See Clause 9.</p>
<p>Test procedures</p> <pre> module TestCase12 { import from TestSystem1 all ; // See T-1 modulepar { octetstring mp_applicationData_i1 } ; // Contents of a new application file modulepar { octetstring mp_managementData_m1 } ; // Contents of AMT // These module parameters shall be provided prior to the execution of the test case. testcase tc_t12 () runs on TSSState1 { // See T-1 // Install the test application sourceCode := "managerCertificate-b" ; // Wrong manager certificate destinationCode := a_OBEorWAEid ; controlIdentifier := "installation" ; // Installation can be replaced by modification or uninstallation aPLIdentifier := "testApplication-a" ; applicationData := mp_applicationData_i1 ; writeInstruction := sourceCode & destinationCode & controlIdentifier & aPLIdentifier & applicationData ; writeInstruction := '01'O & writeInstruction ; // Message header addition pt_installer.send (writeInstruction) ; t_installer.start(300.0) ; // The duration can be changed. // sourceCode := a_OBEorWAEid ; destinationCode := "managerCertificate-b" ; resultCode := "Manager certificate error" ; resultWriteInstruction := sourceCode & destinationCode & controlIdentifier & aPLIdentifier & resultCode ; resultWriteInstruction := '02'O & resultWriteInstruction ; // Message header addition alt { [] pt_installer.receive(resultWriteInstruction) { t_installer.stop ; setverdict(pass) ; } [] pt_installer.receive { t_installer.stop ; setverdict(fail) ; // Unexpected message received } } [] alt_timeGuard (t_installer) ; </pre>

}
}

```

NOTE When an application or a common file is modified, the old program or data is saved in the test installer by executing T-4 before T-2. The old program or data is used for the restoration function.

Annex C (informative)

Commands in test procedures

C.1 General

The following commands can be used for installation, uninstallation and modification in the test procedures of Annex A and Annex B.

C.2 OBE/WAE initiated download case

The following methods can be used for the life cycle management of bundles. In this subclause, the word “method” is used for the meaning of Java language, i.e. a “method” corresponds to a function in C language. Also the “bundle” means a service, i.e. an application in the meaning of CALM-applied ITS applications.

<code>installBundle(String)</code>	This method installs a bundle from the specified location string (which should be a URL).
<code>installBundle(String, InputStream)</code>	This method installs a bundle from the specified <code>InputStream</code> object.
<code>uninstall()</code>	This method uninstalls a bundle from the framework.
<code>update()</code>	This method updates a bundle.
<code>update(InputStream)</code>	This method updates a bundle from the specified <code>InputStream</code> object.

The following methods can be used for the confirmation after the above commands.

<code>getBundle()</code>	This method returns the single bundle object associated with the <code>BundleContext</code> object.
<code>getBundles()</code>	This method returns an array of the bundles currently installed in the framework.
<code>getBundle(long)</code>	This method returns the bundle object specified by the unique identifier, or returns null if no matching bundle is found.

NOTE Once a bundle has been installed, a bundle object is created. The bundle object contains the information on the bundle state (i.e. installed, uninstalled, etc.).

<code>getState()</code>	This method returns this bundle's current state (i.e. installed, uninstalled, etc.).
-------------------------	--

The framework specification is defined in ISO 24101-1:2008, Annex A.

C.3 Installer initiated download case

The following commands are specified for the installer initiated download. See ISO 24101-1:2008, Annex B.

<code>writeInstruction</code>	This command is used for the instruction of installation, uninstallation or modification of the application.
<code>readInstruction</code>	This command is used for the instruction of reading out the application.
<code>readAMTInstruction</code>	This command is used for the instruction of reading out the AMT.

The responses corresponding to the above commands are also specified as follows.

<code>resultWriteInstruction</code>	Response to <code>writeInstruction</code>
<code>resultReadInstruction</code>	Response to <code>readInstruction</code>
<code>resultReadAMTInstruction</code>	Response to <code>readAMTInstruction</code>

.....

Annex D (normative)

Implementation conformance statement proforma

D.1 Identification of IUT

Table D.1 — Identification of IUT form

Name of AM	
Model number of AM	
Revision number of AM	
Supplier of AM	

D.2 Declaration of EUT

Table D.2 — Declaration of EUT form

EUT	
NOTE	An EUT is either OBE or WAE.

D.3 Identification of EUT supplier

Table D.3 — Identification of EUT supplier form

Company	
Postal address	
Telephone	
E-mail address	

D.4 Identification of EUT

Table D.4 — Identification of EUT form

Brand	
Type, version	
Manufacturer	
Serial numbers of supplied devices	

D.5 Declaration of download method and means

D.5.1 Declaration of download method

Table D.5 — Download method form

Download method	Used/Not used, restrictions
OBE/WAE initiated download	
Installer initiated download	

D.5.2 Declaration of download means

Table D.6 — Download means form

Communication	Media	Used/Not used, restrictions
Wired communication	Via network	
	Via dedicated line	
	Memory card	
	Others	
Wireless communication		

D.6 Declaration of API environment

Table D.7 — API environment form

API environment	Used/Not used, restrictions
APIE-1: API on VM	
APIE-2: OS-dependent API	
APIE-3: CPU-dependent API	
NOTE	See ISO 24101-1:2008, Clause 10 for the API environment.

D.7 Declaration of executed test number

Table D.8 — Executed test number form

Test number	Test name	Executed/Not executed, restrictions
Basic tests	T-1	Installation of application
	T-2	Modification of application
	T-3	Uninstallation of application
	T-4	Function of reading application
	T-5	Installation of common file
	T-6	Modification of common file
	T-7	Uninstallation of common file
	T-8	Function of reading common file
	T-9	Function of reading AMT information
	T-10	Function of the scheduled update
Advanced tests	T-11	Operator authentication
	T-12	Manager certificate
	T-13	The same file name
	T-14	Lack of sufficient available memory space
	T-15	Prohibition of AME start while an application is running
	T-16	Prohibition of application start while AME is running
	T-17	Abnormal termination of download
	T-18	Archival records
	T-19	Restoration function

D.8 Declaration of method for the scheduled application updates

NOTE	See ISO 24101-1:2008, Clause 11 for the classification code.

Annex E (normative)

Implementation eXtra information for testing proforma

E.1 Declaration of test applications and common files

Table E.1 — Test applications and common files form

Test application/ Common file	Name	Test purpose	Program ID	Definition of predetermined states when test application/Common file is executed
Test application	testApplication-a	Installation		
	testApplication-b1	Modification		
	testApplication-b2	Modification		
	testApplication-c	Uninstallation		
Common file	commonFile-a	Installation		
	commonFile-b1	Modification		
	commonFile-b2	Modification		
	commonFile-c	Uninstallation		

E.2 Declaration of test installer

Table E.2 — Display method of test installer form

Display method	Used/Not used, restrictions
Messages on display	
Light emitting diode(s)	
Others	

E.3 Declaration of verification means

E.3.1 Verification method after communication with the communication station

Table E.3 — Verification method after communication form

Verification method	Used/Not used, restrictions
Messages on display	
Light emitting diode(s)	
Others	

E.3.2 Method of reading the AMT information

Table E.4 — Method of reading the AMT information form

Method	Used/Not used, restrictions
Debugger	
Emulator	
Equipment using personal computer	
Others	

E.3.3 Method of setting the EUT state

Table E.5 — Method of setting the EUT state form

Setting item	Method
Setting the clock data in EUT (T-10)	
Rewriting the available memory space data in AMT (T-14)	
Application start while AME is running (T-16)	
Abnormal termination of download (T-17)	
Halt under program execution (T-19)	

E.4 Declaration of communication station

Table E.6 — Communication station form

CALM medium	Standard/Specification	Restrictions and remarks
NOTE See ISO 21217 for the CALM media.		

E.5 Declaration of security information

E.5.1 Standards/Specifications for operator authentication

Table E.7 — Operator authentication form

Standard/specification	Restrictions and remarks

E.5.2 Standards/Specifications for manager certificate

Table E.8 — Manager certificate form

Standard/Specification	Restrictions and remarks

E.6 Declaration of installer functions

Table E.9 — Installer functions form

Function	Used/Not used, restrictions
Archival records	
Restoration function	
Function to confirm communication environment	
NOTE See ISO 24101-1:2008, Clause 9 for the installer functions.	

Table E.10 — Function to confirm communication environment form

Monitoring method	Used/Not used, restrictions
The method of detecting RSSI	
The method of detecting BER	
The method of detecting PER	
Others	
NOTE See ISO 24101-1:2008, 9.4 for the function to confirm communication environment.

British Standards Institution (BSI)

BSI is the independent national body responsible for preparing British Standards and other standards-related publications, information and services.

It presents the UK view on standards in Europe and at the international level.

It is incorporated by Royal Charter.

Revisions

British Standards are updated by amendment or revision. Users of British Standards should make sure that they possess the latest amendments or editions.

It is the constant aim of BSI to improve the quality of our products and services. We would be grateful if anyone finding an inaccuracy or ambiguity while using this British Standard would inform the Secretary of the technical committee responsible, the identity of which can be found on the inside front cover.

Tel: +44 (0)20 8996 9001 Fax: +44 (0)20 8996 7001

BSI offers Members an individual updating service called PLUS which ensures that subscribers automatically receive the latest editions of standards.

Tel: +44 (0)20 8996 7669 Fax: +44 (0)20 8996 7001

Email: plus@bsigroup.com

Buying standards

You may buy PDF and hard copy versions of standards directly using a credit card from the BSI Shop on the website www.bsigroup.com/shop. In addition all orders for BSI, international and foreign standards publications can be addressed to BSI Customer Services.

Tel: +44 (0)20 8996 9001 Fax: +44 (0)20 8996 7001

Email: orders@bsigroup.com

In response to orders for international standards, it is BSI policy to supply the BSI implementation of those that have been published as British Standards, unless otherwise requested.

Information on standards

BSI provides a wide range of information on national, European and international standards through its Knowledge Centre.

Tel: +44 (0)20 8996 7004 Fax: +44 (0)20 8996 7005

Email: knowledgecentre@bsigroup.com

Various BSI electronic information services are also available which give details on all its products and services.

Tel: +44 (0)20 8996 7111 Fax: +44 (0)20 8996 7048

Email: info@bsigroup.com

BSI Subscribing Members are kept up to date with standards developments and receive substantial discounts on the purchase price of standards. For details of these and other benefits contact Membership Administration.

Tel: +44 (0)20 8996 7002 Fax: +44 (0)20 8996 7001

Email: membership@bsigroup.com

Information regarding online access to British Standards via British Standards Online can be found at www.bsigroup.com/BSOL

Further information about BSI is available on the BSI website at www.bsigroup.com/standards

Copyright

Copyright subsists in all BSI publications. BSI also holds the copyright, in the UK, of the publications of the international standardization bodies. Except as permitted under the Copyright, Designs and Patents Act 1988 no extract may be reproduced, stored in a retrieval system or transmitted in any form or by any means – electronic, photocopying, recording or otherwise – without prior written permission from BSI. This does not preclude the free use, in the course of implementing the standard of necessary details such as symbols, and size, type or grade designations. If these details are to be used for any other purpose than implementation then the prior written permission of BSI must be obtained. Details and advice can be obtained from the Copyright & Licensing Manager.
