Committees responsible for this British Standard

The preparation of this British Standard was entrusted by the Surgical Instruments and Medical Equipment Standards Committee (SGC/-) to Technical Committee SGC/18 upon which the following bodies were represented:

British Institute of Surgical Technologists
 British Medical Association
 British Orthopaedic Association
 British Steel Industry
 British Surgical Trades Association Incorporated
 Department of Health and Social Security
 National Association of Drop Forgers and Stampers
 Royal College of Surgeons of England
 Royal Veterinary College
 Society of Thoracic and Cardiovascular Surgeons

The following bodies were also represented in the drafting of the standard, through subcommittees and panels:

Ministry of Defence
 Scottish Health Services
 Coopted members

This British Standard, having been prepared under the direction of the Surgical Instruments and Medical Equipment Standards Committee, was published under the authority of the Board of BSI and comes into effect on 31 January 1984

© BSI 10-1999

Foreword

This British Standard has been prepared under the direction of the Surgical Instruments and Medical Equipment Standards Committee.

Advancements in the field of implant surgery proceed by the collaborative efforts of those skilled in a number of diverse activities, each having a specialized language. Definitions of terms relating to surgical implants were prepared with two main purposes in view, namely:

- a) to promote precision and uniformity in the use of terms relating to the various aspects of surgical implants;
- b) to enable workers in different fields to understand one another.

The intention has been to provide information on terms used in the biological, medical, engineering and materials science aspects of surgical implants. It is emphasized that many of the terms included in this Part of BS 6324 will be found in British Standards directly concerned with particular disciplines, as well as in many text books. The wording of these definitions has in some instances been modified to facilitate understanding of the concepts by readers who are not specialists in these particular disciplines; the definitions are not otherwise incompatible with the general definitions as used and understood in the relevant industries. Every attempt has been made to align the terms and definitions with modern practice. This glossary does not purport to be a comprehensive list of all terms used in connection with surgical implants and has been restricted to those terms most frequently used. Where terms are considered to be deprecated, this has been stated.

The glossary has been prepared in four Parts as follows:

- *Part 1: Glossary of general medical terms;*
- *Part 2: Glossary of terms relating to mechanics;*
- *Part 3: Glossary of terms relating to materials;*
- *Part 4: Glossary of orthopaedic surgical terms.*

Further consideration is being given to the preparation of other Parts covering such fields as cardiovascular, neuro-surgical and genito-urinary implant surgery.

Attention is also drawn to the Parts of BS 3531 dealing with surgical implants.

Each term in the glossary has been allocated a number of the type 20101 where the first three digits indicate the section number and the first digit of that group indicates the Part of the glossary. The remaining two digits give the term number within the section.

Where two or more terms have the same meaning, the preferred term is given in bold type and the other terms are given in medium type and, if deprecated, are so indicated.

An alphabetical index of the terms contained in each Part of the glossary is given at the end of that Part. Those terms given in italic typeface in the definitions are themselves defined elsewhere in the same Part and are included in the index for ease of reference.

A British Standard does not purport to include all the necessary provisions of a contract. Users of British Standards are responsible for their correct application.

Compliance with a British Standard does not of itself confer immunity from legal obligations.

Summary of pages

This document comprises a front cover, an inside front cover, pages i and ii, pages 1 to 12, an inside back cover and a back cover.

This standard has been updated (see copyright date) and may have had amendments incorporated. This will be indicated in the amendment table on the inside front cover.

Section 201. Basic mechanical terms

NOTE Unless otherwise qualified, the definitions contained in this Part of BS 6324 use the term "body" in an engineering sense.

No.	Term	Definition
20101	force	That which, acting on a body, tends to cause it to undertake linear acceleration. NOTE The SI unit of force is the newton (N).
20102	couple	Two equal and opposite <i>forces</i> acting along parallel lines of action and tending to cause rotation of the body to which they are applied. NOTE The value of the couple is given by the magnitude of one force multiplied by the perpendicular distance between the lines of action of the forces. The SI unit of couple is the newton metre (N m).
20103	mass	The quantity of matter in a body. NOTE The SI unit of mass is the kilogram (kg).
20104	weight	That <i>force</i> which is exerted on a body by the mutual attraction (gravity) between it and the earth. NOTE The SI unit of weight is the newton (N).
20105	load	Any system of <i>forces</i> and/or <i>couples</i> applied to a body.
20106	free body diagram	An illustration of all the loads acting on a body or a part of a body allowing analysis of the loading on each body part. NOTE When the loading on a body component is analysed, a single part or any group of parts may be studied and the equations of equilibrium are satisfied for each part or group of parts. Attention should be paid to all the loads transmitted by the external environment and by the remainder of the body at the section joining this part or group of parts to the rest of the body.
20107	pressure	The <i>force</i> divided by the area of the surface on which the force acts. NOTE The SI unit of pressure is the pascal (Pa); 1 Pa = 1 N/m ² .
20108	moment	The turning effect of a <i>force</i> about an axis. NOTE The value of a moment is given by the product of the force and the distance measured perpendicularly from the axis to the line of action of the force. The SI unit of moment is the newton metre (N m).
20109	torque	A <i>moment</i> , generally about the long axis of a body, that tends to produce twisting (<i>torsion</i>). NOTE The SI unit of torque is the newton metre (N m).
20110	torsion	The twisting rotation of one end of a body relative to the other, generally about the long axis, caused by <i>torque</i> .
20111	bending moment	The <i>moment</i> acting about an axis perpendicular to the long axis of a body and generally producing lateral deflection. NOTE It is usually applied to a body with one long axis (i.e. with ratio of length to width greater than 6 : 1). The unit of bending moment is the newton metre (N m).
20112	resultant force and couple	The single <i>force</i> and single <i>couple</i> representing the total effect of a system of forces and couples that are acting on a body or part of a body. NOTE The resultant force will produce the same linear acceleration of the body as the system of forces.
20113	cross-sectional area	That area which is exposed when a section is taken perpendicular to the longitudinal axis of the body. NOTE The SI unit of cross-sectional area is the square metre (m ²).
20114	centroid	The effective geometric centre of an area.

No.	Term	Definition
20115	centre of gravity	The point at which the <i>mass</i> of all parts of the body may be considered to be concentrated for calculations relating to gravitational and inertial <i>forces</i> .
20116	second moment of area	A property of a <i>cross-section</i> related to its area and the distribution of the area relative to its <i>centroid</i> . NOTE It is used in the calculation of <i>stresses</i> due to bending in the elastic region and is not to be confused with <i>second moment of mass</i> . The SI unit of second moment of area is the metre to the fourth power (m ⁴).
20117	second moment of mass moment of inertia	A property of a body related to its <i>mass</i> and the distribution of mass relative to the <i>centre of gravity</i> . NOTE It is used in the calculation of angular acceleration due to <i>torque</i> and is not to be confused with <i>second moment of area</i> . The unit of second moment of mass is the kilogram metre squared (kg m ²).
20118	polar moment of area	A property of the <i>cross-section</i> of a circular bar and the distribution of area relative to the <i>centroid</i> . NOTE It is used in the calculation of <i>shear stress</i> due to <i>torsion</i> of a bar of circular cross-section. The unit of polar moment of area is the metre to the fourth power (m ⁴).
20119	axial force normal force	The <i>force</i> whose line of action coincides with the line joining the <i>centroids</i> of successive <i>cross-sections</i> of a part of a body.
20120	tensile force extensional force	A <i>force</i> tending to increase the length of a part of a body.
20121	compressive force	A <i>force</i> tending to produce shortening of the length of a part of a body.
20122	shear force	That component of the <i>resultant force</i> acting on a cross-section of a body and having a line of action perpendicular to the axis of that body, or acting on the surface of a body and having a line of action tangential to the surface.
20123	work	The product of a <i>force</i> and the distance moved by the point of application of the force along the line of action of the force. NOTE Similarly, work is done when a <i>couple</i> produces an angular displacement. The SI unit of work is the joule (J); 1 J = 1 N m.
20124	energy	The capacity for doing <i>work</i> . NOTE In mechanical systems this will be in the form of potential energy (relating to the possibility of <i>work</i> being done by gravity); kinetic energy (corresponding to the instantaneous linear and/or angular velocity of the body) or strain energy corresponding to the energy stored and available for release in a deformed body. The SI unit of energy is the joule (J); 1 kW h = 3.6 × 10 ⁶ J.
20125	power	The rate of doing <i>work</i> or supplying <i>energy</i> . NOTE The SI unit of power is the watt (W); 1 W = 1 J/s.
20126	instantaneous centre	The imaginary point, not necessarily in the body, about which a body having general motion may, at a given instant, be considered to be rotating or moving, relative to another body. NOTE The principle is exemplified by the human knee joint in which the tibial and femoral condyles slide in relation to one another during flexion. The instantaneous centre thus traces a path around a selected condyle.
20127	fluid	A substance that flows and that differs from a solid in that it can offer no permanent resistance to change of shape.
20128	gas	The state of matter in which molecules move freely, thereby expanding indefinitely and occupying the total volume of any vessel in which the matter is contained.

No.	Term	Definition
20129	liquid	The state of matter in which the shape of a given <i>mass</i> depends on the containing vessel, but the volume is independent thereof. NOTE A liquid is frequently assumed to be incompressible.
20130	turbulent flow	Flow of a <i>fluid</i> in which the particle motion at any point varies rapidly in magnitude and direction giving rise to high resistance to flow.
20131	laminar flow streamline flow	Flow of a <i>fluid</i> in which adjacent layers do not mix, except on a molecular scale. NOTE See also Part 1 of this standard.

Section 202. Mechanics of materials

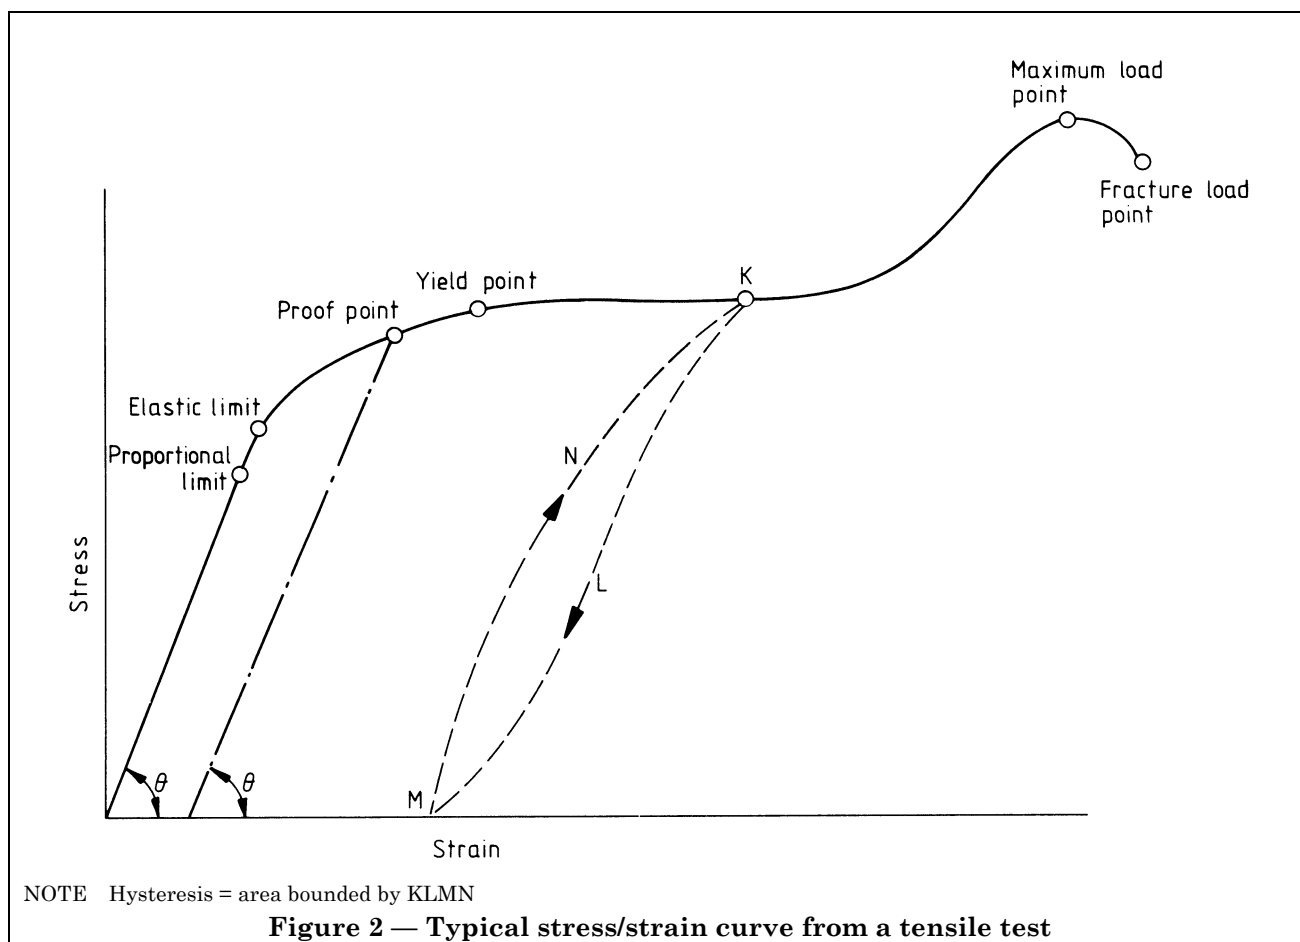

20201	stress	The intensity of the internal <i>forces</i> (or components of a force) at a point in a body that can act on a given plane through the point. The numerical value of stress is the quotient of the force and the area on which it acts. NOTE Generally a uniform distribution of stress exists only where the resultant <i>load</i> is a <i>tensile or compressive force</i> whose line of action intersects the <i>centroid</i> . The appropriate SI unit of stress is the megapascal (MPa). $1 \text{ MPa} = 1 \text{ MN/m}^2 = 1 \text{ N/mm}^2$.
20202	normal stress direct stress	The <i>stress</i> or component of stress acting perpendicular to a given plane. NOTE A normal stress may be either a <i>tensile stress</i> or a <i>compressive stress</i> depending on the direction of the <i>force</i> .
20203	tensile stress	The <i>stress</i> caused by a <i>force</i> tending to increase the length of a body.
20204	compressive stress	The <i>stress</i> caused by a <i>force</i> tending to decrease the length of a body.
20205	shear stress	The <i>stress</i> or component of stress acting tangentially to a given plane.
20206	bending stress	The <i>tensile</i> and <i>compressive stresses</i> developed on opposite sides of a body due to the application of a <i>bending moment</i> .
20207	shear stress due to torsion torsion stress, <i>deprecated</i>	The <i>shear stresses</i> produced in a body by the application of <i>torque</i> .
20208	volumetric stress hydrostatic stress	A three-dimensional <i>tensile</i> or <i>compressive stress</i> system in which the magnitude of the stress is the same in all directions.
20209	hoop stress	The <i>stress</i> in a circumferential direction in a body of cylindrical or spherical shape.
20210	radial stress	The <i>stress</i> applied in the radial direction in a body of cylindrical or spherical shape.
20211	resultant stress	The single <i>stress</i> at a point, representing the total effect of the stresses due to each of several <i>load</i> systems acting on a body.
20212	stress raiser	A scratch, crack, notch, void, inclusion, change in cross-section or change in contour that causes <i>stress concentration</i> .
20213	stress concentration	The increased value of <i>stress</i> existing in the region of a <i>stress raiser</i> compared with that occurring in the same region of a similarly loaded uniform body.
20214	stress concentration factor	The ratio of the value of a <i>stress concentration</i> to the value occurring at the corresponding point in a uniform body subjected to the same <i>loading</i> .

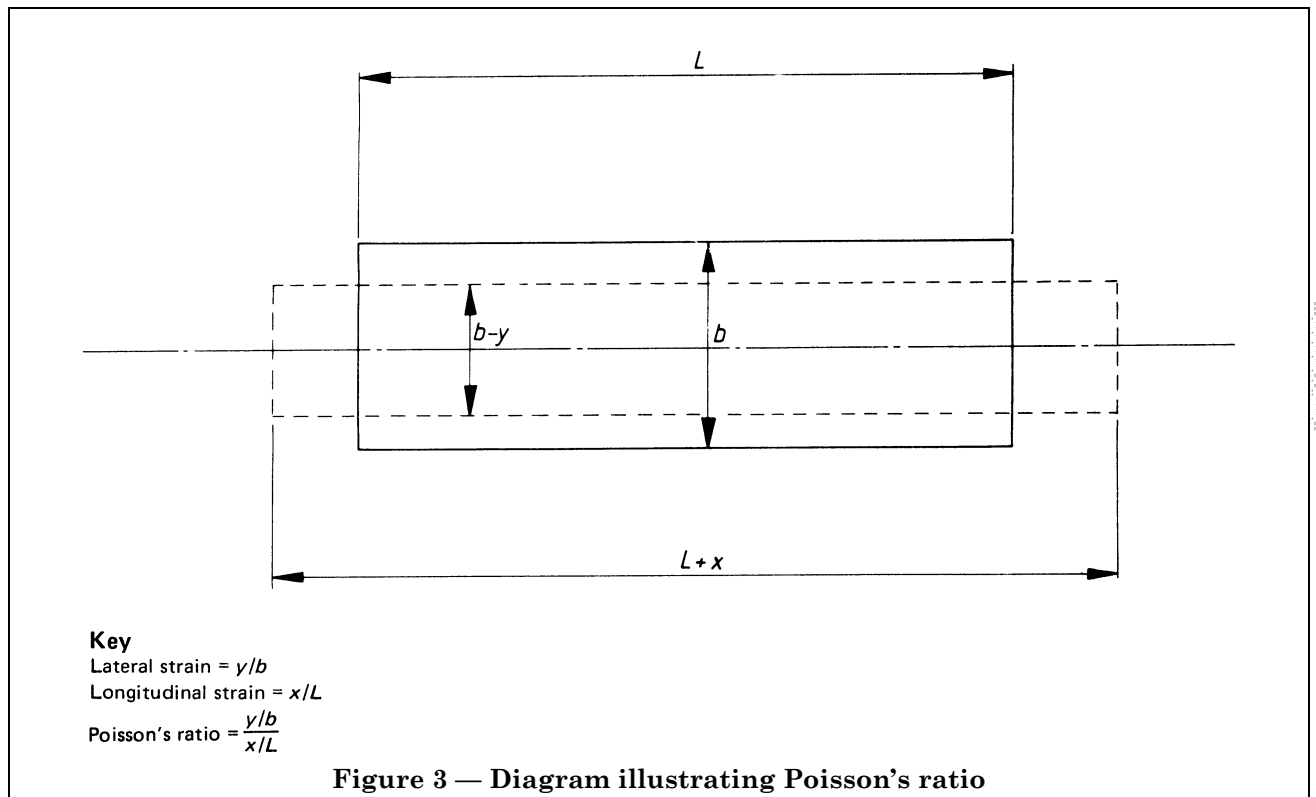

No.	Term	Definition
20215	thermal stress	The <i>stress</i> developed within a body when free thermal expansion or contraction is restrained or the temperature throughout a body is non-uniform.
20216	residual stress	The <i>stress</i> remaining in a body after removal of any system of external <i>loads</i> or temperature gradients.
20217	deformation	A change in the dimensions or shape of a body.
20218	angular deflection	The angle to which a test piece deflects when subjected to an applied <i>moment</i> . NOTE The commonly used unit of angular deflection is the degree (°); the SI unit of plane angle is the radian.
20219	strain	The ratio of the <i>deformation</i> of a body or part of a body to its original dimension, e.g. an increase in length under tensile <i>load</i> divided by the original length.
20220	normal strain	The ratio of the change of length of a body to its original length. NOTE Normal strain may be tensile or compressive.
20221	shear strain tangential strain	The <i>strain</i> resulting from <i>shear stress</i> . NOTE Where an element of a body of shape ABDC deforms as shown in Figure 1 the shear strain is defined as angle <i>g</i> . The SI unit of shear strain is the radian.
20222	volumetric strain	The ratio of change in volume to the original volume.
20223	strain gauge	A device affixed usually to the surface of a body to measure <i>normal strain</i> in a specified direction over the area of attachment.
20224	stress/strain curve	A diagram in which the corresponding values of <i>stress</i> and <i>strain</i> are plotted against each other. NOTE It is generally obtained from a tensile test of the material (see Figure 2).
20225	elastic deformation	The <i>deformation</i> , due to the application of a <i>load</i> , that diminishes to zero on removal of that load.
20226	plastic deformation permanent deformation	The <i>deformation</i> that remains after the removal of the <i>load</i> that caused it.
20227	viscoelastic deformation	<i>Deformation</i> that comprises <i>elastic</i> , <i>plastic</i> and <i>fluid flow</i> components.
20228	elastic modulus	The ratio of <i>stress</i> to the corresponding <i>strain</i> within the initial linear region of the <i>stress/strain curve</i> for a material.
20229	Young's modulus	The <i>elastic modulus</i> relating the <i>normal stress</i> to the <i>strain</i> . NOTE The appropriate SI unit of Young's modulus is the megapascal (MPa); 1 MPa = 1 MN/m ² = 1 N/mm ² .
20230	shear modulus rigidity modulus	The <i>elastic modulus</i> relating the <i>shear stress</i> to the <i>shear strain</i> . NOTE The appropriate SI unit of shear modulus is the megapascal (MPa); 1 MPa = 1 MN/m ² = 1 N/mm ² .
20231	bulk modulus	The <i>elastic modulus</i> relating the <i>volumetric stress</i> to the <i>volumetric strain</i> . NOTE The appropriate SI unit of bulk modulus is the megapascal (MPa); 1 MPa = 1 MN/m ² = 1 N/mm ² .
20232	Poisson's ratio	The ratio of the lateral <i>strain</i> to the longitudinal strain in a body loaded by a <i>tensile force</i> only. NOTE See Figure 3.
20233	load/elongation curve	The curve of variation of the axial <i>load</i> and the elongation on a specified <i>gauge length</i> of a tensile test specimen. NOTE With appropriate changes of scales this may be used as a <i>stress/strain curve</i> .

No.	Term	Definition
20234	proportional limit	The point in a <i>stress/strain curve</i> relating to a tensile test at which there is significant deviation from the initial linear region. NOTE See Figure 2.
20235	proportional limit stress	The <i>stress</i> at the <i>proportional limit</i> .
20236	elastic limit	The greatest <i>stress</i> that a material is capable of sustaining without any permanent <i>strain</i> remaining upon the complete release of the stress. NOTE See Figure 2.
20237	elastic limit stress	The <i>stress</i> at the <i>elastic limit</i> .
20238	proof stress	The <i>stress</i> in a test piece corresponding to a permanent <i>strain</i> or permanent <i>deformation</i> of a prescribed amount, e.g. 0.1 %.
20239	proof load	The <i>load</i> carried by a test piece or structure that corresponds to a permanent <i>deformation</i> of a prescribed amount.
20240	stiffness	The <i>load</i> per unit <i>deformation</i> within the <i>proportional limit</i> . NOTE Examples are the <i>force</i> per unit stretch, the <i>moment</i> per unit angular deformation, the <i>torque</i> per angle of twist. Contrast with <i>flexibility</i> .
20241	yield	That part of the <i>stress/strain curve</i> relating to a tensile test which is essentially parallel to the <i>strain</i> axis and where an increase in strain occurs without an increase in <i>stress</i> . NOTE See that part of the curve shown in Figure 2 between the yield point and point K.
20242	yield stress	The <i>load</i> at <i>yield</i> in a tensile test divided by the original <i>cross-sectional area</i> .
20243	tensile strength ultimate tensile stress	The maximum <i>force</i> in a tensile test divided by the original <i>cross-sectional area</i> of the test piece, i.e. the <i>stress</i> corresponding to the maximum <i>load</i> . NOTE The appropriate SI unit of tensile strength is the megapascal (MPa); 1 MPa = 1 MN/m ² = 1 N/mm ² .
20244	maximum load ultimate load	The highest <i>load</i> that the test piece withstands in a tensile test. NOTE See Figure 2.
20245	true stress	The <i>stress</i> in a tensile test calculated from the <i>cross-sectional area</i> at the time of measurement of the <i>load</i> rather than from the original cross-sectional area.
20246	hysteresis	The phenomenon whereby the loading curve differs from the unloading curve for any point in a <i>stress/strain curve</i> . NOTE In Figure 2, if the test is conducted up to point K and unloading takes place along line KLM, the typical curve representing reloading follows path MNK. The area KLMN represents the mechanical energy loss.
20247	creep	The continuous <i>deformation</i> of a material when subjected to <i>stress</i> over an extended period. NOTE Generally, the higher the stress and the temperature, the higher will be the rate of deformation. A typical creep curve is shown in Figure 4.
20248	creep limit creep strength	The highest <i>stress</i> at a given temperature that a material can withstand without excessive <i>deformation</i> .
20249	creep rate	The rate of <i>strain</i> corresponding to particular <i>load</i> and temperature conditions as given by the slope of the second stage of the <i>creep curve</i> . NOTE See Figure 4. The SI unit for creep rate is the reciprocal second (s ⁻¹).

No.	Term	Definition
20250	ductility	The capacity of a material to undergo permanent (<i>plastic</i>) <i>deformation</i> . NOTE In a ductile fracture a cup and cone shape or "ears", together with a finely textured surface appearance corresponding to large amounts of local deformation, are frequently evident.
20251	brittleness	The absence of significant <i>deformation</i> before fracture. NOTE Some materials may exhibit a transition from ductile to brittle behaviour, depending on the temperature, the speed of application of <i>load</i> and the <i>stress</i> distribution. In a brittle fracture there is no significant reduction in <i>cross-sectional area</i> and the surface may have a bright crystalline appearance.
20252	flexibility	<i>Deformation per unit load</i> . NOTE Contrast with <i>stiffness</i> .
20253	gauge length	The original length of that portion of the test specimen over which <i>strain</i> or change of length is determined.
20254	extensometer	An instrument for measuring the average extension on the <i>gauge length</i> of a tensile test specimen.
20255	compression test	A test conducted, generally on a short specimen of cylindrical form (maximum length/diameter ratio of 2.0), in which a compressive <i>load</i> is uniformly applied to each end face.
20256	reduction in area	The reduction of <i>cross-sectional area</i> of a tensile test piece measured after fracture and expressed as a percentage of the original cross-sectional area.
20257	elongation	The increase in <i>gauge length</i> of a tensile test piece measured after fracture and expressed as a percentage of the original gauge length. NOTE Generally this value is valid only if the fracture has occurred within the middle third of the gauge length.
20258	ultimate shear stress	The maximum <i>stress</i> occurring during a test in pure shear (i.e. without <i>tensile</i> or <i>bending stress</i>). NOTE The ultimate shear stress can be obtained accurately only from a torsional test on a thin tube.
20259	fatigue failure	The failure of a test piece or component under repeated cycles of <i>load</i> , each less than the maximum load of the test piece.
20260	S/N curve	A graph relating stress to the number of cycles of load to failure in a fatigue test.
20261	fatigue limit stress fatigue limit; endurance limit	The highest <i>stress</i> that will not cause failure regardless of the number of <i>load</i> cycles. NOTE This limit is only found in certain metals in non-corrosive environments (see also <i>corrosion fatigue</i>). The appropriate SI unit of fatigue limit is the megapascal (MPa); 1 MPa = 1 MN/m ² = 1 N/mm ² .
20262	corrosion fatigue	The failure due to repeated cycles of <i>load</i> in a corrosive environment. NOTE Generally, in a corrosive environment, the number of load cycles to failure at a given <i>stress</i> is reduced, and there is no <i>fatigue limit stress</i> .
20263	impact test	A test in which a test piece is dynamically loaded to fracture. NOTE Generally the bar is notched at the region of maximum <i>stress</i> and loaded in bending. The maximum <i>energy</i> required to fracture the bar is measured. This energy cannot be directly related to other mechanical properties.
20264	notch sensitivity	The reduction of the strength of certain materials in the presence of <i>stress raisers</i> .
20265	toughness	The characteristic of a material that requires high <i>energy</i> to cause fracture.

No.	Term	Definition
20266	hardness	<p>The capacity of a material to resist indentation.</p> <p>NOTE It may correlate with <i>wear</i> resistance and <i>yield stress</i>. Hardness is usually determined by the use of an indentation type of machine such as Vickers (diamond pyramid hardness) (HV), Brinell (HB) or Rockwell (HR). In each case a dimensionless number is obtained which is reported relative to the test conditions, e.g. Vickers (at the stated load), Brinell (at the stated F/D^2 value), Rockwell (using the stated scale).</p>
20267	photoelasticity	<p>The phenomenon in which the transmission of light through certain transparent materials is dependent on local <i>strain</i>.</p> <p>NOTE In suitable cases, using plane polarized light, the <i>stress</i> at a point in a model can be inferred from the optical fringe patterns produced. If a thin photoelastic coating (stress coat) is applied to a component, an analysis of the fringes allows the determination of the surface strain when the component is loaded.</p>
20268	finite element stress analysis	<p>A numerical method of analysis of the <i>stress</i> in a component obtained by considering the component to be divided into a finite number of small elements.</p> <p>NOTE Using this technique the behaviour of a complicated component can be predicted under any assumed system of <i>loads</i>.</p>
20269	wear	<p>Removal or transfer of material from contacting surfaces due to their relative movement under <i>load</i>.</p> <p>NOTE Wear may be measured by <i>mass</i> change, volume measurement or by the depth of the wear tracks (see also Part 3 of this standard).</p>
20270	friction coefficient	<p>The ratio of the tangential friction force to the <i>axial force</i> between two surfaces when relative movement is occurring or about to commence.</p>
20271	lubrication	<p>The interposition of solid, liquid or gaseous material between two surfaces to reduce the friction or <i>wear</i> occurring during relative movement.</p>
20272	fretting	<p>The <i>wear</i> occurring between two close-fitting surfaces corresponding to repeated small relative movements.</p>

Figure 4 — Typical creep curve

Alphabetical index

The method of alphabetization used in this index is word-by-word.

Entries beginning with the same word are listed in the order:

- a) a single word entry;
- b) the same word modified by a qualifier;
- c) compound entries beginning with the same word.

The references are not to page numbers, but to term numbers. The word “see” against an entry indicates that the term itself is not defined but that information on the term may be found in the indicated entry.

BS 3531-1, *Specification for basic requirements: Finish, marking and packaging.*

BS 3531-2, *Specification for materials for metal surgical implants.*

BS 3531-3, *Specification for forged components made of wrought stainless steel, wrought titanium and of wrought titanium alloy.*

BS 3531-4, *Specification for castings made of cobalt-chromium-molybdenum alloy.*

BS 3531-5, *Specification for surgical bone screws of 4 mm, 3.5 mm and 3 mm nominal sizes, countersunk surfaces on bone plates, twist drills, taps and screwdrivers.*

BS 3531-6, *Specification for skeletal pins and wires.*

BS 3531-7, *Specification for acrylic bone cement.*

BS 3531-8, *Specification for ceramic materials based on alumina.*

BS 3531-9, *Specification for general requirements for orthopaedic joint replacements.*

BS 3531-10, *Specification for classification, designation of dimensions and general requirements for partial and total hip joint replacements.*

BS 3531-11, *Specification for staples for use in orthopaedic surgery.*

BS 3531-12, *Classification and designation of dimensions for knee joint prostheses.*

¹⁾ Referred to in the foreword only.

BSI — British Standards Institution

BSI is the independent national body responsible for preparing British Standards. It presents the UK view on standards in Europe and at the international level. It is incorporated by Royal Charter.

Revisions

British Standards are updated by amendment or revision. Users of British Standards should make sure that they possess the latest amendments or editions.

It is the constant aim of BSI to improve the quality of our products and services. We would be grateful if anyone finding an inaccuracy or ambiguity while using this British Standard would inform the Secretary of the technical committee responsible, the identity of which can be found on the inside front cover. Tel: 020 8996 9000. Fax: 020 8996 7400.

BSI offers members an individual updating service called PLUS which ensures that subscribers automatically receive the latest editions of standards.

Buying standards

Orders for all BSI, international and foreign standards publications should be addressed to Customer Services. Tel: 020 8996 9001. Fax: 020 8996 7001.

In response to orders for international standards, it is BSI policy to supply the BSI implementation of those that have been published as British Standards, unless otherwise requested.

Information on standards

BSI provides a wide range of information on national, European and international standards through its Library and its Technical Help to Exporters Service. Various BSI electronic information services are also available which give details on all its products and services. Contact the Information Centre. Tel: 020 8996 7111. Fax: 020 8996 7048.

Subscribing members of BSI are kept up to date with standards developments and receive substantial discounts on the purchase price of standards. For details of these and other benefits contact Membership Administration. Tel: 020 8996 7002. Fax: 020 8996 7001.

Copyright

Copyright subsists in all BSI publications. BSI also holds the copyright, in the UK, of the publications of the international standardization bodies. Except as permitted under the Copyright, Designs and Patents Act 1988 no extract may be reproduced, stored in a retrieval system or transmitted in any form or by any means – electronic, photocopying, recording or otherwise – without prior written permission from BSI.

This does not preclude the free use, in the course of implementing the standard, of necessary details such as symbols, and size, type or grade designations. If these details are to be used for any other purpose than implementation then the prior written permission of BSI must be obtained.

If permission is granted, the terms may include royalty payments or a licensing agreement. Details and advice can be obtained from the Copyright Manager. Tel: 020 8996 7070.
