BSI Standards Publication

Health Informatics - Business requirements for a syntax to exchange structured dose information for medicinal products (ISO/TS 17251:2016)

National foreword

This Published Document is the UK implementation of CEN ISO/TS 17251:2016.

The UK participation in its preparation was entrusted to Technical Committee IST/35, Health informatics.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

English Version

**Health Informatics - Business requirements for a syntax to
exchange structured dose information for medicinal
products (ISO/TS 17251:2016)**

Informatique de santé - Exigences d'affaire pour une
syntaxe d'échange d'informations de dose structurée
pour les produits médicaux (ISO/TS 17251:2016)

Medizinische Informatik - Geschäftsanforderungen an
eine Syntax zum Austausch von Dosisinformationen für
Arzneimittel (ISO/TS 17251:2016)

This Technical Specification (CEN/TS) was approved by CEN on 10 July 2016 for provisional application.

The period of validity of this CEN/TS is limited initially to three years. After two years the members of CEN will be requested to submit their comments, particularly on the question whether the CEN/TS can be converted into a European Standard.

CEN members are required to announce the existence of this CEN/TS in the same way as for an EN and to make the CEN/TS available promptly at national level in an appropriate form. It is permissible to keep conflicting national standards in force (in parallel to the CEN/TS) until the final decision about the possible conversion of the CEN/TS into an EN is reached.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

European Foreword

This document (CEN ISO/TS 17251:2016) has been prepared by Technical Committee ISO/TC 215 “Health informatics” in collaboration with Technical Committee CEN/TC 251 “Health informatics” the secretariat of which is held by NEN.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to announce this Technical Specification: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Endorsement notice

The text of ISO/TS 17251:2016 has been approved by CEN as CEN ISO/TS 17251:2016 without any modification.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 215, *Health informatics*.

Introduction

The requirements for the exchange of structured dose instructions are intended to be independent of any technology standard or software platform and have been developed with the aim of specifying the necessary clinical and business requirements precisely and unambiguously. Implementation of the requirements within a suitable medium designed to support communication of healthcare information can provide support to clinicians and their applications in storing, retrieving, using, and above all, communicating dose instructions information to other clinicians, their applications, and most importantly, to the patient.

The primary audiences for this Technical Specification are software developers building clinical IT systems.

Health informatics — Business requirements for a syntax to exchange structured dose information for medicinal products

1 Scope

This Technical Specification specifies the business requirements for the structured content of structured or semi-structured dose instructions for recording dose instructions in the electronic health record (EHR), supporting clinical decision support, and in exchanging medication orders, as applicable to primary, secondary and tertiary care.

NOTE See 2.9, note to entry, regarding the use of “medication order” and “prescription”.

Comprehension of dose instructions by the patient is an overarching consideration for patient safety and the best patient outcomes. Related factors are discussed, but are not part of the primary scope.

This Technical Specification does not define an information model, except to the extent that those information model concepts are necessary to define business requirements.

Outside the scope of this Technical Specification are:

- the functionality of health, clinical and/or pharmacy systems;
- other kinds of content of health, clinical or pharmacy systems that are needed to support the whole process of health care providers, such as:
 - wide range of knowledge about medicines that would be handled in drug knowledge databases and decision support systems;
 - the complete medical record (EHR);
 - a medicinal product dictionary.

2 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

2.1

dose instructions

instructions pertaining to the medication, which describe the amount of medication per dose, method of administration, the frequency or interval of dose, associated instructions for dosing or skipped doses, and other associated parameters necessary for appropriate administration of the medication

2.2

dose syntax

structured dose instructions

structured set of data elements which represent the dose instructions in a consistent, computable format

2.3

structured information

information assembled from predefined concepts (vocabulary or code set) using an organizational scheme (information model)

2.4
unstructured information

information assembled from narrative words and word fragments, following either casual conventions or language-specific grammatical rules

2.5
semi-structured information
information containing both structured content and unstructured content

2.6
sig
directions to be written on a package or label for the use of the patient

Note 1 to entry: Sig (sometimes written as SIG) appears to be an acronym, but is an abbreviation of the Latin term “signā”.

Note 2 to entry: In the context of this Technical Specification, “sig” had the same meaning as “dose instructions” (see [4.1](#)).

2.7
storage and handling information
information provided to the patient/caregiver regarding the appropriated conditions to maximize the shelf life of the medicinal product

Note 1 to entry: While essential information, this does not directly relate to administration and is not within the scope of this Technical Specification.

2.8
medication order
documented instruction on intended therapy for an individual person with a medicinal product issued by an authorized health professional

Note 1 to entry: There is no inherent limitation on the setting for the medication order (inpatient, ambulatory, etc.).

[SOURCE: ISO/TR 22790:2007]

2.9
prescription
directions created by an authorized health professional to instruct a dispensing agent regarding the preparation and use of a medicinal product or medicinal appliance to be taken or used by a subject of care

Note 1 to entry: In the context of this Technical Specification, “prescription” or “medication order” could be used. We have chosen to use “medication order”. In this sense, we imply that “medication order” is inclusive of “prescription.”

[SOURCE: ISO/TR 22790:2007]

2.10
message syntax
structured set of data elements which represent the medication order in a consistent computable format

3 Conformance

Systems that create or consume electronic medication orders can claim conformance to this Technical Specification when it fulfils all requirements in Clause 4.

4 Business requirements for structured dose instructions

4.1 General

The business requirements for structured dose information shall focus on the primary goal of ensuring that the patient receives the appropriate medication dose at the appropriate time in a consistent manner. In addition to the patient-centric aspects, certain information is required to achieve this goal. The following requirements address both patient and information aspects.

NOTE The following conformance statements refer to either, or both, the message syntax and the dose syntax. Requirements which are not unique to the dose instructions, or useful in other components of a medication order, are described as part of the “message syntax”. Requirements which are specific to the dose instructions are described as part of the “dose syntax”.

4.2 Use cases

Dose instructions serve the following use cases.

- Indicating the right dosage during prescribing.
- Recording the indicated dosage in the EHR:
 - to be used in clinical decision support systems, like dose checking;
 - exchange of information between health care providers.
- Indicating comprehensible dose instructions on the patient label in order to make clear how to use the medicine. Comprehension may not be a component of the dose instructions specifically, but comprehension does influence the presentation of the instructions to the patient. Patient comprehension information shall be present in the medication order in some manner such that the dispenser can create appropriate instructions for the patient or caregiver.

4.3 Elements of a dose instruction

Based on the use cases, the elements of a dose instruction include the following.

- Text representation. The purpose of this Technical Specification is to specify requirements for structured dose instructions. However, some parts of a dose instruction cannot be captured in structured information. To support a human readable text of the whole dose instruction of a certain medicine, a textual representation of the whole dose instructions will remain an important element. This textual representation includes both the structured and the unstructured part of the dose instruction. Also, if a scenario occurs which prevents the structured content from being produced, the textual representation is then necessary for communicating the dose instruction. The structured content and the textual content, if both are present, shall agree, neither omitting nor adding any significant content between the two.
- Amount of medication to be administered at each dose event.
 - This may be comprised of a number of units of presentation (e.g. “1 tablet”) or a number and unit of measure (e.g. “5 ml”, “500 mg”). Calculated amounts (e.g. “50 mg/kg body weight”) may be appropriate in some cases, however an explicit amount is generally preferred over an implied amount.
 - The administered amount may vary over time (e.g. tapered dose) or relative to other parameters (e.g. insulin sliding scale).
 - The administered amount may be a range (1 to 2 tablets).
 - The administered amount should be quantified whenever possible. Indeterminate and non-quantifiable amounts (e.g. “apply a thin film”, “use a pea-sized amount”) should be quantified

wherever possible (e.g. “apply 1 to 2 ml”, “use 1 to 2 gm”) or the non-quantifiable portion included in a text representation element.

- Route of administration.
- Timing of dose event(s). A wide range of dose timing shall be considered. Possibilities include the following.
 - Dosing by frequency (e.g. “twice a day”, “once a month”), dosing by time interval (e.g. “every 6 hours”). Both frequency and interval require a numeric portion and a time portion, frequency being “<number> per <time>” and interval expressing “every <number> <time>”. The numeric portions may involve ranges (e.g. “every 3 to 4 days”).
 - Dosing at specific times (e.g. “at 9 am”), or relative to other events (e.g. meals, sleep, procedures).
 - There may be a start date, and/or time, for dose events. This may be specific (e.g. “begin on 3 October 2015”) or relative (e.g. “the day prior to the procedure”).
 - Dose timing can also be a combination of timing patterns running consecutively (e.g. tapers) or concurrently (e.g. “daily and as needed”).
- Conditional administration. Administration of a dose may be dependent upon other factors. Such factors may be symptoms (e.g. “as needed for cough”), measurable parameters (e.g. “blood glucose > 200 mg/dl”, “temperature > 38 °C”), event or encounter (e.g. “after bee sting”). The use of unspecified or indeterminate conditions (e.g. “as needed” without condition) is not supported in this Technical Specification.
- Ancillary information. As with the textual representation, this information not typically represented in the structured dose instructions and is included here as they are often discussed in relation to dose instructions. Examples include:
 - storage and handling (e.g. keep refrigerated, shake well before use);
 - advise on proper administration (e.g. take with food);
 - reference to dosing information provided elsewhere (e.g. medications following a documented protocol).

Dose instructions do not exist on their own; they are a component of the medication order, and thus the prescriber and dispenser systems. These systems are, in turn, related to other health, clinical, and/or pharmacy information systems. Some aspects of the dose instructions, and the dose syntax model, may be dependent on information in these other systems. Examples of such “other information” include patient weight for weight-based dosing, and procedure schedules for doses administered relative to that event. It is recognized that this Technical Specification includes requirements which are not specifically elements of dose instruction, but may be needed for appropriate interpretation and implementation of the dose instructions. Conformance of a dose syntax model, and dose instructions produced from that model, is not dependent of these “other information” requirements.

4.4 Information requirements

4.4.1 General

The requirements for structured dose information, or the “dose syntax,” are described in this subclause. These requirements build on the elements discussed in 4.2.

Dose syntax can only be assessed for structured (no textual representation present) and semi-structured (textual representation present) dose instructions. For structured, and the structured portion of semi-structured, dose instructions, the following requirements are defined. Some of these “requirements” describe “capabilities” or “features” which will not be used in all structured dose information instances.

Dose instructions can be very complex. Aggregates of sequential and alternating dosing are not uncommon (e.g. “4 tablets once a week (2 in the morning, 2 in the evening)” for methotrexate). Another complex example involves dosing multiple products dispensed as one “kit” [e.g. Didrokit, “once a week 1 tablet (=Didronel) in the morning, 6 times a week 1 tablet (=Cacit) in the evening”]. This specification addresses the information requirements for dose syntax models and derived dose instructions. This Technical Specification does not address all of the possible combinations and permutations of the elements.

4.4.2 Infrastructure

4.4.2.1 Information model

4.4.2.1.1 The dose syntax shall employ an information model.

4.4.2.1.2 The information model shall support the use of standardized vocabularies.

4.4.2.1.3 The dose syntax and the information model may or may not directly produce the patient instructions, but shall always provide a consistent presentation to the pharmacy/dispenser from which patient-friendly dose instructions can be created.

4.4.2.1.4 The information model should use, or be mapped to, the information model(s) used by related health information systems.

4.4.3 Text representation

Text representation of the dose instructions, if present, shall be consistent with any coded representation of the dose instructions.

4.4.4 Administration amount

The dose to administer is typically expressed as a numeric value and a unit of measure (e.g. 15 ml) or unit of presentation (e.g. 1 tablet).

4.4.4.1 The dose syntax model shall support an expression of the numeric value of the dose to be administered at each dosing event.

4.4.4.2 The dose syntax model shall support both a single value (e.g. 1) and a value range (e.g. 1 to 2) for the numeric value of the dose to be administered at each dosing event.

4.4.4.3 The dose syntax model shall support the expression of the dose unit/unit of presentation for each dosing event (e.g. tablet, ml, puff, mg/kg).

4.4.4.4 The dose syntax model should support the expression of the dose unit/unit of presentation for each dosing event (e.g. tablet, ml) based upon a standardized vocabulary.

4.4.4.5 The dose syntax model may support the expressions of calculated administration amounts (e.g. 50 mg/kg of body weight).

4.4.5 Route/site of administration

4.4.5.1 The dose syntax model shall support the expression of the route of administration for each dosing event (e.g. “oral”, “topical”, “ocular”).

4.4.5.2 The dose syntax model should support the expression of the route of administration for each dosing event (e.g. “oral”, “topical”, “ocular”) based upon a standardized vocabulary.

4.4.5.3 The dose syntax model shall support the expression of the site of administration for each dosing event (e.g. “left deltoid”, “right eye”).

4.4.5.4 The dose syntax model should support the expression of the site of administration for each dosing event (e.g. “left deltoid”, “right eye”) based upon a standardized vocabulary.

4.4.6 Timing of dose event(s)

4.4.6.1 Timing

4.4.6.1.1 The dose syntax model shall support expressing the timing of dosing events as a number of events per period of time (frequency) (e.g. “3 times a day”, “once a week”), as a numeric value and a value to express the unit of time.

4.4.6.1.2 The dose syntax model shall support expressing the timing of dosing events as spaced at equal intervals of time (interval) (e.g. “every 8 hours”).

4.4.6.1.3 The dose syntax model shall support expressing the timing of dosing events as a range of events per interval of time (e.g. “3 to 4 times a day”).

4.4.6.1.4 The dose syntax model shall support expressing the timing of dosing events as spaced at a range of intervals of time (e.g. every 6 to 8 weeks).

4.4.6.1.5 The dose syntax model shall support expressing the timing of dosing event as specific points of time (e.g. “9 am”, “10 am and 6 pm”).

4.4.6.1.6 The dose syntax model shall support expressing the timing of dosing events related to activities of daily living (e.g. “morning”, “at bedtime”).

4.4.6.1.7 The dose syntax model shall support expressing the timing of dosing events as offsets to activities of daily living (e.g. “take 30 min prior to breakfast”, “take 30 minutes prior to appointment”).

4.4.6.1.8 The dose syntax model shall support expressing the timing of dosing events as days within a week (e.g. “every Monday”).

4.4.6.1.9 The dose syntax model shall support expressing the timing of dosing event as days within a month (e.g. “on the first of every month”).

4.4.6.1.10 The dose syntax model should support the expression of the timing (e.g. ‘per day’, ‘per week’) and time (e.g. “hour”, “day”) based upon a standardized vocabulary.

4.4.6.2 Sequential and alternating dosing

4.4.6.2.1 The dose syntax model should support sequential sets of dosing instructions (e.g. “2 now, then 1 every day”, “3 tablets on first day, 2 tablets on second day, 1 tablet on third day”).

4.4.6.2.2 The dose syntax model should support alternating set of dosing instructions (e.g. “1 tablet every Monday, and 2 tablets every Thursday”, or “1 tablet on Monday, Wednesday, Friday, 2 tablets on Tuesday, Thursday, and Saturday, no dose on Sunday”).

4.4.6.3 Start/duration

- 4.4.6.3.1** The dose syntax model shall support the date/time on which administration should start.
- 4.4.6.3.2** The dose syntax model should support the date/time on which the administration should end.
- 4.4.6.3.3** The dose syntax model should support administration start and end as relative to other events (e.g. “begin 1 day prior to procedure”).
- 4.4.6.3.4** The dose syntax model shall support termination of dosing events (e.g. “until gone”, “then stop”).
- 4.4.6.3.5** The dose syntax model should support dosing event duration (e.g. “apply for 10 minutes”, “infuse over 30 minutes”, “continuous”).
- 4.4.6.3.6** The dose syntax model should support dosing rate for parenteral products (e.g. “250 mg/hr”, “125 ml/hr”, “continuous”).
- 4.4.6.3.7** The dose syntax model should support therapy duration (e.g. “for 10 days”, “during 6 months”).

This is the intended duration of the therapy, not the calculated date on which the supplied medication should be used up.

- 4.4.6.3.8** The dose syntax model should support maximum therapy durations (e.g. not longer than 7 days).

4.4.7 Conditional administration

- 4.4.7.1** The dose syntax model shall support the expression of conditions for administration (e.g. “as needed for pain”, “for temperature above 100 °F”).
- 4.4.7.2** The dose syntax model should support the expression of conditions for administration in controlled vocabularies; this includes both valued concepts (e.g. “equal to or greater than” and “100” and “° F”) and unvalued concepts (e.g. “as needed for pain”).
- 4.4.7.3** The dose syntax model shall support limitations on the number of doses permitted in a specified period of time (e.g. “not more than 4 doses in 24 hours”).
- 4.4.7.4** The dose syntax model should support the expression of conditions that result in alteration of administration (e.g. “discontinue if rash develops”, “skip dose when prior to dental appointment”).

4.4.8 Patient-specific information

4.4.8.1 General

This information is not specifically part of the dose instructions. This information may influence the how the dose instructions are prepared or rendered for the patient/caregiver. This information is typically found in other aspects of the medication order, or related to capabilities of the messaging protocols.

Since these elements may not be under the control of the same system containing the dose syntax model, these “requirements” are not binding on the dose syntax model, or dose instructions produced

by that model. The dose syntax model may state conformance to this Technical Specification without addressing this patient-specific information.

4.4.8.2 Language

4.4.8.2.1 The primary language of communication for the patient/caregiver should be present in the message syntax.

4.4.8.2.2 The language should be coded using ISO 639-1 or ISO 639-2.

4.4.8.2.3 Multiple languages may be included for the patient/caregiver.

4.4.8.2.4 If multiple languages are specified for the patient/caregiver, then the patient/caregiver's preferred language shall be indicated.

4.4.8.2.5 The patient/caregiver's ability to understand written instructions in their preferred and alternate languages may be indicated.

4.4.8.2.6 This proficiency may be indicated as a "grade-level" or "good/fair/poor" rating.

4.4.8.3 Functional limitations

Patient functional limitations which may influence the patient's ability to read and act on the dose instructions should be supported by the message syntax.

Examples of functional limitations include, but are not limited to:

- limited visual acuity;
- limited dexterity;
- impaired cognitive function.

4.4.8.4 Patient characteristics

Where clinically appropriate, a prescriber may indicate an amount to administer relative to height, weight, body surface area or other patient characteristics. To support this, the following recommendations apply.

4.4.8.4.1 The message syntax should have the capability to communicate necessary patient characteristics (e.g. patient height, weight, body surface area).

4.4.8.4.2 If the dosage is supplied as a calculated value, then the medication order message syntax should include the patient characteristics required for the indicated calculation.

4.4.9 Ancillary information

Examples include storage and handling (e.g. keep refrigerated, shake well before use), advise on appropriate administration (e.g. take with food), or reference to dosing information provided elsewhere (e.g. medications following a documented protocol). As with the textual representation, this information is not typically represented in the structured dose instructions and is included here only as they are often discussed in relation to dose instructions.

British Standards Institution (BSI)

BSI is the national body responsible for preparing British Standards and other standards-related publications, information and services.

BSI is incorporated by Royal Charter. British Standards and other standardization products are published by BSI Standards Limited.

About us

We bring together business, industry, government, consumers, innovators and others to shape their combined experience and expertise into standards-based solutions.

The knowledge embodied in our standards has been carefully assembled in a dependable format and refined through our open consultation process. Organizations of all sizes and across all sectors choose standards to help them achieve their goals.

Information on standards

We can provide you with the knowledge that your organization needs to succeed. Find out more about British Standards by visiting our website at bsigroup.com/standards or contacting our Customer Services team or Knowledge Centre.

Buying standards

You can buy and download PDF versions of BSI publications, including British and adopted European and international standards, through our website at bsigroup.com/shop, where hard copies can also be purchased.

If you need international and foreign standards from other Standards Development Organizations, hard copies can be ordered from our Customer Services team.

Copyright in BSI publications

All the content in BSI publications, including British Standards, is the property of and copyrighted by BSI or some person or entity that owns copyright in the information used (such as the international standardization bodies) and has formally licensed such information to BSI for commercial publication and use.

Save for the provisions below, you may not transfer, share or disseminate any portion of the standard to any other person. You may not adapt, distribute, commercially exploit, or publicly display the standard or any portion thereof in any manner whatsoever without BSI's prior written consent.

Storing and using standards

Standards purchased in soft copy format:

- A British Standard purchased in soft copy format is licensed to a sole named user for personal or internal company use only.
- The standard may be stored on more than 1 device provided that it is accessible by the sole named user only and that only 1 copy is accessed at any one time.
- A single paper copy may be printed for personal or internal company use only.

Standards purchased in hard copy format:

- A British Standard purchased in hard copy format is for personal or internal company use only.
- It may not be further reproduced – in any format – to create an additional copy. This includes scanning of the document.

If you need more than 1 copy of the document, or if you wish to share the document on an internal network, you can save money by choosing a subscription product (see 'Subscriptions').

Reproducing extracts

For permission to reproduce content from BSI publications contact the BSI Copyright & Licensing team.

Subscriptions

Our range of subscription services are designed to make using standards easier for you. For further information on our subscription products go to bsigroup.com/subscriptions.

With **British Standards Online (BSOL)** you'll have instant access to over 55,000 British and adopted European and international standards from your desktop. It's available 24/7 and is refreshed daily so you'll always be up to date.

You can keep in touch with standards developments and receive substantial discounts on the purchase price of standards, both in single copy and subscription format, by becoming a **BSI Subscribing Member**.

PLUS is an updating service exclusive to BSI Subscribing Members. You will automatically receive the latest hard copy of your standards when they're revised or replaced.

To find out more about becoming a BSI Subscribing Member and the benefits of membership, please visit bsigroup.com/shop.

With a **Multi-User Network Licence (MUNL)** you are able to host standards publications on your intranet. Licences can cover as few or as many users as you wish. With updates supplied as soon as they're available, you can be sure your documentation is current. For further information, email subscriptions@bsigroup.com.

Revisions

Our British Standards and other publications are updated by amendment or revision.

We continually improve the quality of our products and services to benefit your business. If you find an inaccuracy or ambiguity within a British Standard or other BSI publication please inform the Knowledge Centre.
