Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

In exceptional circumstances, when a technical committee has collected data of a different kind from that which is normally published as an International Standard ("state of the art", for example), it may decide by a simple majority vote of its participating members to publish a Technical Report. A Technical Report is entirely informative in nature and does not have to be reviewed until the data it provides are considered to be no longer valid or useful.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO/TR 12389 was prepared by Technical Committee ISO/TC 74, *Cement and lime*.

Introduction

This Technical Report summarizes the results of inter-laboratory testing of the chemical analysis of cement by x-ray fluorescence undertaken by laboratories in Japan, in Asian countries and in Europe. This testing programme was planned and conducted by the Committee on Cement Chemistry, Japan Cement Association and extended to the members of ISO in Asia and members of CEN/TC 51/WG 15 (Revision of methods of testing cement) in Europe. A total of 42 laboratories participated.

The wet method is a longstanding technique used for chemical analysis of cement. However, since this manner of analysis is extremely time-consuming, more rapid methods have been investigated, leading to the development of chemical analysis of cement by x-ray fluorescence (XRF method). As a result, Japanese Industrial Standard JIS R 5204 was established in July 2002.

JIS R 5204 established a scheme to confirm the validity of calibration equations when the concentrations of a pair of validation beads made from certified reference materials satisfy the criteria for both the repeatability limits and accuracy limits specified in JIS R 5204. Use of this validation system improves the repeatability and accuracy of results obtained by the JIS R 5204 method.

Since an International Standard for this analysis method had not yet been established, the Japanese National Committee for ISO/TC 74 (J/TC 74) proposed the "Development of chemical analysis of cement by x-ray fluorescence" to ISO/TC 74 in June 2004. The English version of JIS R 5204 was included as the first working draft at that time.

In order to introduce JIS R 5204 to Asian members of ISO/TC 74 and to promote technical exchange among them, an inter-laboratory testing programme was organized. This inter-laboratory testing was carried out with the participation of 16 laboratories in Japan and 14 outside Japan, mostly Asian members of ISO/TC 74.

As this first part of the round-robin testing was taking place, work was in progress within CEN committee TC 51/WG 15 to produce a standard method for the chemical analysis of cement by x-ray fluorescence. The Japanese Industrial Standard JIS R 5204 was accepted by this committee and, working jointly with the Japanese co-opted member, was incorporated into the draft for ISO 29581-2. At the invitation of the Japanese Cement Association, members of CEN/TC 51/WG 15 were invited to join in the Japanese/Asian round robin and in 2005 twelve European laboratories participated. The results of their testing are included in this report.

Those laboratories that obtained analyses of JCA-CRM-1 and/or JCA-CRM-2 satisfying the criteria for both the repeatability limits and accuracy limits for all components were defined as "Q-laboratories". A comparison of the results for "Q-laboratories" with those obtained from other inter-laboratory testing for all constituents other than CaO indicates that the variation was equal to or smaller than that of wet analysis. The variation in results for CaO in "Q-laboratories" was slightly larger than that by wet analysis. Therefore, this inter-laboratory testing demonstrates that the accuracy of results obtained by the JIS R 5204/ISO 29581-2 method is generally the same as that for the wet method.

Methods of testing cement — Report of a test programme — Chemical analysis by x-ray fluorescence

1 Scope

This Technical Report describes the results of the inter-laboratory testing of the chemical analysis of cement by x-ray fluorescence. In the first instance, the inter-laboratory testing was carried out in Japan and in Asian countries in accordance with JIS R 5204:2002. A total of 30 laboratories, 16 in Japan and 14 outside Japan, participated in the original testing programme. A further 12 European laboratories participated in tests with the same materials in 2005 in accordance with EN 196-2, a development by CEN/TC 51/WG 15/TG 1 of JIS R 5204. The latest version, developed as ISO 29581-2, is, as of the date of publication of this Technical Report, in the process of being circulated for technical enquiry.

The test samples used were Portland cement conforming to CEM I of EN 197-1 and a mixture of Portland cement and blast furnace slag. The mixture corresponded to the composition of Portland blast furnace slag cement, class B, specified in JIS R 5211 and CEM III/A of EN 197-1. Cement reference materials for x-ray fluorescence analysis (No. 601A) are used for the calibration standards, and certified reference materials JCA-CRM-1 and JCA-CRM-2 are used as the validation materials.

Constituents analysed include SiO_2 , Al_2O_3 , Fe_2O_3 , CaO , MgO , SO_3 , Na_2O , K_2O , TiO_2 , P_2O_5 , MnO and SrO . The loss on ignition is also determined.

The ISO round robin is a method-performance study conducted under close to optimum conditions with clear calibration and measurement guidelines. This is conducive to producing “best practice” values representative of the ideal situation. However, ISO 29581-2 is intended for use under everyday conditions in laboratories that operate to “good practice”. Annex D sets out the results of some international round robins carried out by a large number of laboratories demonstrating the suitability of ISO 29581-2 as a means for comparing the everyday performance of laboratories.

2 Test methods

2.1 General arrangements

The outline of the inter-laboratory testing is shown in Table 1.

Table 1 — Outline of the inter-laboratory testing

Test method	First part – JIS R 5204:2002 Second part – ISO 29581-1
Test samples	JCA #1 Portland cement JCA #2 Cement made by mixing Portland cement with blast furnace slag (composition corresponding to Portland blast furnace slag cement Class B specified in JIS R 5211 and CEM III/A of EN 197-1)
Calibration standards	Cement reference materials for x-ray fluorescence analysis, JCA No. 601A
Validation materials	JCA-CRM-1 Ordinary Portland cement JCA-CRM-2 Portland blast furnace slag cement
Constituents determined	SiO ₂ , Al ₂ O ₃ , Fe ₂ O ₃ , CaO, MgO, SO ₃ , Na ₂ O, K ₂ O, TiO ₂ , P ₂ O ₅ , MnO, SrO, loss on ignition (LOI)

2.2 Test method and constituents to be determined

The first phase of this inter-laboratory testing was based on JIS R 5204. The second phase of this inter-laboratory testing was based on ISO 29581-2. There were no substantial differences between the two methods. For the remainder of this report they will be referred to as "the XRF method".

Twelve constituents: SiO_2 , Al_2O_3 , Fe_2O_3 , CaO , MgO , SO_3 , Na_2O , K_2O , TiO_2 , P_2O_5 , MnO , and SrO , determined by XRF method using glass beads, and loss on ignition were to be evaluated. Although SO_3 for Portland blast furnace slag cement was outside the scope of JIS R 5204, it was an option for Sample #2 in this testing.

3 Samples

3.1 Test samples

Two test samples were used: Portland cement (Sample #1) conforming to EN 197-1 CEM I, and a cement mixture of Portland cement and blast furnace slag (Sample #2). Sample #2 corresponded to the B-type Portland blast furnace slag cement specified in JIS R 5211 and CEM III/A of EN 197-1. Approximately 30 g of each sample was distributed.

3.2 Calibration standards

Cement reference materials for x-ray fluorescence analysis (see NOTE), provided by the Japan Cement Association, were used for the calibration standards.

Approximately 12 g of each standard of JCA No. 601A was distributed to the foreign laboratories. The only requirement was that seven or more calibration standards be used when making calibration equations in accordance with the XRF method.

NOTE JCA No. 601A is a set of 15 cement reference materials consisting of nine Portland cements and six Portland blast furnace slag cements.

3.3 Validation materials

Validation of calibration equations was specified in the XRF method. Certified reference materials JCA-CRM-1 and JCA-CRM-2, provided by the Japan Cement Association, were used as the validation materials.

Approximately 30 g of each CRM was distributed to the laboratories.

3.4 Participating laboratories

3.4.1 Japan

An announcement of the inter-laboratory testing was sent out to members of the Japan Cement Association. In response to the announcement, 16 laboratories registered as participants in this testing programme. A list of participating laboratories is shown in Annex A.

3.4.2 Asia

An announcement of the inter-laboratory testing was sent out to Asian members registered as P-members or O-members in ISO/TC 74 (See NOTE). Sixteen laboratories responded to the announcement and expressed their desire to participate, and 14 laboratories registered for the programme. A list of participating laboratories is shown in the Annex A.

NOTE The announcement was sent out to member bodies registered in ISO/TC74, and to Cement Associations of the members; see Reference [10].

3.4.3 Europe

Invitations were issued to the members of European Standards Organization Technical Committee TC 51, *Cement and building limes*, Working Group 15, *Methods of testing cement*, Task Group 1, *Analysis by x-ray fluorescence*, to nominate participating laboratories. Twelve laboratories undertook to participate. A list of participating laboratories is shown in Annex A.

4 Method for analysis of results

4.1 Statistics

Symbols and definitions of statistical terms used in this report are shown in Table 2.

Table 2 — Definitions of the statistical terms

Statistical term	Abbreviation/symbol	Definition of the statistical term ^a
Average	Av./ \bar{x}	$\bar{x} = \frac{\sum_{i=1}^n x_i}{n}$
Maximum value	Max.	Maximum value in the data
Minimum value	Min.	Minimum value in the data
Range	—	Range is equal to max. minus min.
Standard deviation	S.D./ σ	$\sigma = \sqrt{\frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n-1}}$
Coefficient of variation	C.V./ C_V	$C_V = \frac{\sigma \times 100}{\bar{x}}$, expressed as a percentage

^a n is the number of laboratories; x is the mean value of a pair of results from each laboratory.

4.2 Definition of Q-laboratories

4.2.1 General

In this inter-laboratory testing, a Q-laboratory is one where the concentration of a pair of validation beads made from certified reference materials satisfies the criteria for both the repeatability limits and accuracy limits set out in the XRF method.

4.2.2 Validation procedure

4.2.2.1 Determination of the concentration of a pair of validation beads made from at least one certified reference material for all analysis constituents.

4.2.2.2 Check that the difference in the concentration, rounded off to three decimal places, of a pair of validation beads is within the repeatability limits obtained from Equation (1):

$$\log(y) = 0,48 \log(x) - 1,499 \quad (1)$$

where

y is the repeatability limit, as a percentage;

x is the mean value of the concentration of a pair of validation beads, as a percentage.

When x is less than 0,5 %, a limit for y of 0,020 % is applied to all values.

NOTE Equation (1) is specified in JIS R 5204.

4.2.2.3 Check that the difference between the mean values, rounded off to two decimal places, of the concentration of a pair of validation beads and the “certified values” of the certified reference materials are within the accuracy limits specified according to the level of concentration in Table 3 for each analysed constituent.

Both JCA-CRM-1 and JCA-CRM-2 are used for the validation materials in this inter-laboratory testing. However, in the XRF method, the use of just one certified reference material is permitted. Therefore, for the purpose of this inter-laboratory test, the validations are considered as satisfied if the analysis of either JCA-CRM-1 or JCA-CRM-2 meets the validation criteria. Laboratories that obtained concentrations of JCA-CRM-1 and/or JCA-CRM-2 satisfying the criteria for both the repeatability limits and accuracy limits for all constituents, were defined as "Q-laboratories" in this inter-laboratory testing. In ISO 29581-2, these are referred to as "expert" laboratories.

Table 3 — Accuracy limits for analysis validation

Level of the certified value (% absolute)	Accuracy limits for analysis validation (% absolute)
0,00 to 0,49	0,02
0,50 to 0,99	0,03
1,00 to 6,99	0,08
7,00 to 14,99	0,12
15,00 to 29,99	0,15
30,00 to 49,99	0,20
50,00 to 79,99	0,25
80,00 to 100,00	0,30

5 Results and considerations

5.1 Laboratory number

Validation results for all laboratories and results of determination for Q-laboratories are shown in Tables B.1 to B.8. Laboratories No. 1 to No. 16 represent laboratories in Japan; Laboratories No. 101 to No. 113 represent ISO member laboratories outside Japan. Although there were 14 participating laboratories outside Japan, the report submitted by Laboratory No. 114 is mentioned only in Tables B.2, B.4, B.6 and B.8, because the laboratory carried out XRF analysis by the pellet method. Laboratories No. E1 to E12 represent laboratories participating in the European stage.

5.2 Validation results for all laboratories

The difference in concentration for each pair of JCA-CRM-1 is shown in Table 4, and that for JCA-CRM-2 is shown in Table 5. The difference between the mean values of concentration for each pair of JCA-CRM-1 and the certified values is shown in Table 6, and that for JCA-CRM-2 is shown in Table 7.

Data in the shaded cells of Table 4 and Table 5 denote results that did not satisfy the required criteria for repeatability. Data in the shaded cells of Table 6 and Table 7 represent results that did not satisfy the required criteria for accuracy limits. “-” in each table indicates that there is no report from the laboratory for that constituent.

The presence of data in the shaded cells indicates that some validation results did not satisfy the required criteria for repeatability or accuracy limits. Therefore, in determining the Q-laboratories according to the definition described in 4.2, 27 laboratories were judged as Q-laboratories.

Table 4 — Difference in concentrations for each pair of validation beads
(All laboratories — Validation material: JCA-CRM-1)

Laboratory ref.	SiO ₂ %	Al ₂ O ₃ %	Fe ₂ O ₃ %	CaO %	MgO %	SO ₃ %	Na ₂ O %	K ₂ O %	TiO ₂ %	P ₂ O ₅ %	MnO %	SrO %

NOTE Data in shaded cells represent concentrations that did not satisfy the required criteria for accuracy limits for "expert" laboratories specified for the XRF method.

a "Mean value" is the mean value of the concentrations of a pair of validated beads.

b "Diff." is the difference between the mean value of the concentrations of a pair of validated beads and the certified value for the validation material.

Table 7 — Differences between the mean value of the concentrations of a pair of validation beads and the certified value
(All laboratories — Validation material: JCA-CRM-2)

NOTE Data in shaded cells represent concentrations that did not satisfy the required criteria for accuracy limits for "expert" laboratories specified for the XRF method.

a SO₃ determination for JCA-CRM-2 is outside the scope of JIS R 5204.

b "Mean value" is the mean value of the concentrations of a pair of validated beads.

c "Diff." is the difference between the mean value of the concentrations of a pair of validated beads and the certified value for the validation material.

5.3 Test results of Q-laboratories

5.3.1 Differences in concentration for each pair of test samples

The differences in concentration for each pair of Sample JCA #1 and Sample JCA #2 is shown in Table 8 and Table 9.

Table 8 — Differences in concentrations for each pair of test sample
(Q-laboratories —Test sample: Sample JCA #1)

NOTE Data in shaded cells represent results that did not satisfy the required criteria for repeatability specified for "expert" laboratories for the XRF method.

a SO₃ determination for sample JCA #2 is outside the scope of JIS R 5204.

b "-" indicates that there was no result reported by the laboratory.

5.3.2 Distribution of concentrations for test samples

Each concentration obtained by Q-laboratories for Sample JCA #1 and Sample JCA #2 is shown in Table 10 and Table 11. "Mean value" represents the average of two concentrations, and "Diff." represents the difference between the "Mean value" and the average, respectively. Data in parentheses are "outliers" by the Grubbs test, which was excluded from statistic calculation of the results.

The Grubbs test specified in 7.3.4 of ISO 5725-2:1994 was carried out when analysing results. "Outlier" means 5% "outlier" by the Grubbs test and "Outliers in Q-laboratory" are shown in the histograms. However, although both the minimum of K₂O and the maximum of SrO for Sample JCA #2 were judged as "outliers", it was concluded that they were not "extreme results" and therefore, they were not excluded.

With regard to judgment of validation for results obtained by XRF analysis using validated calibration, it would be unlikely that the analytical accuracy of the results varies significantly in the same kind of sample without a failure in one of the processes of XRF analysis. For example, both JCA-CRM-1 and Sample JCA #1 are Portland cement, and both JCA-CRM-2 and Sample JCA #2 are Portland blast furnace slag cement.

It is normal practice that when there is a statistical “outlier” it is necessary to conduct an investigation to determine the cause.

The histograms of concentrations of test samples for all constituents are shown in Figure 1 to Figure 23. The data group shown by the shaded bars indicates the data of Q-laboratories, and the white bars indicate the data of the other laboratories (non-Q-laboratories). The average and two times the standard deviation (2σ) shown in the histograms were calculated after excluding “outliers”.

The concentrations obtained by Q-laboratories were generally distributed between the average $\pm 2\sigma$ for all constituents. On the other hand, the distribution of concentrations of non-Q-laboratories was wider than that of Q-laboratories, and there were some concentrations that were far from the average. As reported above, it is important for accurate analysis to use calibration equations validated in accordance with this XRF method.

^a “Mean value” is the mean value of the concentrations of a pair of analysis beads.

^b “Diff.” is the difference between the mean value of the concentrations of a pair of analysis beads and the average for all Q-laboratories.

^c Concentrations in parentheses are the “outliers” by the Grubbs test.

6 Conclusions

6.1 Result of test sample analyses

The average and the standard deviations of reproducibility of test samples obtained from the inter-laboratory testing by x-ray fluorescence are shown in Table 12.

For comparison, standard deviations of reproducibility obtained from the wet-chemistry methods in Inter-laboratory testing, 2004-OC in accordance with JIS R 5202 are also shown in Table 12.

Inter-laboratory testing, 2004-OC was conducted by the Japan Cement Association and the standard deviation of the reproducibility was calculated using only data from the laboratories of cement companies in Japan. Most of these laboratories participated in the inter-laboratory testing by x-ray fluorescence.

NOTE An “Inter-laboratory testing, xxxx-OC” has been conducted by the Japan Cement Association since 1948. “xxxx” stands for the year in which the inter-laboratory testing was conducted.

Table 12 — Comparison between standard deviation obtained by Q-laboratories in this testing and that obtained from data of the wet method in Inter-laboratory testing, 2004-OC

	Sample #2	0,05	0,003		

^a Concentrations in parentheses are the “outliers” by the Grubbs test.

The standard deviations of Q-laboratories are almost equal to or less than those of Inter-laboratory testing, 2004-OC, except for CaO. Therefore, the accuracy of XRF analysis according to the XRF method is considered to be generally equal to that of wet analysis.

For CaO, a few laboratories obtained results that are not within the average ± 2 times the standard deviation, even if the results are not "outliers". Factors affecting the determination of CaO should be investigated further.

As reported in 5.3.2, there are some "outliers", even in the analyses by Q-laboratories. The principle of the method assumes that extreme results should not arise, provided that the calibration used for sample analysis satisfied the criteria for both repeatability limits and accuracy limits. The possibility of error factors in these analyses should be investigated.

6.2 Factors affecting conformity with the validation criteria

The XRF method requires that, when analysing a sample by XRF analysis, it is necessary to satisfy the criteria for repeatability limits and accuracy limits for certified reference materials. This validation is essential for accurate analysis.

Some laboratories were unable to satisfy the validation criteria in this inter-laboratory testing.

In these cases, it is recommended that those laboratories re-check general matters for chemical analysis, such as weighing of samples, performance of spectrometer and general facilities for accurate XRF analysis.

The following matters should also be checked:

- a) bead preparation conditions, such as fusion temperature, flux-to-sample ratio;
- b) repeatability of bead preparation;
- c) procedure for preparing ignited sample;
- d) agreed basis for calculating results, e.g., as-received or loss-free;
- e) procedure for establishing calibration equations, such as range of contents or application of correction for inter-element effect;
- f) measurement conditions for light elements, especially Na₂O, MgO and Al₂O₃.

6.3 Application to other international inter-laboratory testing

ISO 29581-2 is intended for use under everyday conditions in laboratories that operate to "good practice". Annex D sets out the results of some international round robins carried out by a large number of laboratories demonstrating the suitability of ISO 29581-2 as a means for comparing the everyday performance of laboratories.

Annex A (informative)

List of participating laboratories

A.1 Japanese laboratories:

Ube-Mitsubishi Cement Research Institute Corporation, Ube Center
Ube-Mitsubishi Cement Research Institute Corporation, Kurosaki Center
Ube-Mitsubishi Cement Research Institute Corporation, Saitama Center
Ube-Mitsubishi Cement Research Institute Corporation, Sendai Concrete Center
Nippon Steel Blast-Furnace Slag Cement Co., Ltd., Production and Technical Dept., Quality Assurance Group
Sumitomo Osaka Cement Co., Ltd., Production and Technical Dept., Analytical Center
Sumitomo Osaka Cement Co., Ltd., Cement/Concrete Research Laboratory, Cement Chemistry Research Group
Sumitomo Osaka Cement Co., Ltd., Cement/Concrete Research Laboratory, Cement Technology Group
Taiheiyo Cement Corporation, Ofunato Plant, Production Dept., Quality Assurance Section
Taiheiyo Cement Corporation, Kamiiso Plant, Production Dept., Quality Assurance Section
Taiheiyo Cement Corporation, Oita Plant(Saiki), Production Dept., Quality Assurance Section
Taiheiyo Consultant Co., Ltd., Quality Assurance Dept., Chemical Analysis Group
Chuken Consultant Co., Ltd., Kanto Branch, Technical Dev., Material Analytical Section
Tokuyama Corporation, Cement Manufacturing Dept., Technical Section 1
Tosoh Corporation, Cement and Energy Manufacturing Dept., Cement Testing Div.
Japan Cement Association, R & D Laboratory, Basic Research on Cement/Environment Group

A.2 ISO member laboratories – Outside Japan:

China, People's Republic of –	China Building Materials Academy
	Asia Cement Co., Ltd.
	Hanil Cement Co., Ltd.
	Hyundai Cement Co., Ltd., Danyang Plant
	Hyundai Cement Co., Ltd., Yongwol Plant
	Lafarge Halla Cement Corporation

	Ssangyong Cement Industrial Co., Ltd.
	Yongwol Plant
	Sungshin Cement Co., Ltd.
Korea, Republic of –	Tong Yang Cement Corporation, Samchok Plant
Lithuania, Republic of –	Prustitas Co., Ltd.
Philippines, Republic of the –	Cement Manufactures Association/APO Cement Corporation
	Union Cement Corporation, Lugait Plant
Vietnam, Socialist Republic of –	Butson Cement Company
	National Cement Association

A.3 CEN member laboratories:

Italy –	Italcementi Group, Bergamo
France –	Three laboratories co-ordinated by ATILH, Paris
Germany –	VDZ, Research Institute of the Cement Industry, Duesseldorf
	HeidelbergCement Technology Center GmbH, Leimen
Belgium –	CRIC, Brussels
Turkey –	Turkish Cement Manufacturing Association, Ankara
United Kingdom –	Castle Cement Technical Centre, Clitheroe
Netherlands –	ENCI B.V. Vestiging, Maastricht
Spain –	IECA, Madrid
Czech Republic –	Research Institute for Binding Materials, Brno
Poland –	IMMB, Krakow

NOTE One CEN member laboratory was unable to meet the validation criteria and withdrew. It was subsequently discovered that the x-ray tube was unstable.

Annex B (informative)

Individual results of all laboratories

Tables B.1 to B.8 list the results of all laboratories participating in the test programme: Chemical analysis of cement by x-ray fluorescence.

Table B.1 — Individual results for all laboratories — JCA-CRM-1

Annex C (informative)

Questionnaire results

A questionnaire was sent to the participating laboratories and responses were received from 34 laboratories (including some responses where the questionnaire was only partially completed). The summarized results of the questionnaire are shown below, excluding items considered as having originated in individual equipment associated with the bead preparation conditions or measurement conditions.

C.1 Variety of fluxes

Flux used	Number of laboratories
Li ₂ B ₄ O ₇ : 100 %	18
Li ₂ B ₄ O ₇ : 90 %, LiF: 10 %	2
Li ₂ B ₄ O ₇ : 90 %, LiNO ₃ : 10 %	1
Li ₂ B ₄ O ₇ : 84,9 %, LiF: 8,4 %, SrO: 4,6 %, V ₂ O ₅ : 2,1 %	1
Li ₂ B ₄ O ₇ : 80 %, LiF: 20 %	1
Li ₂ B ₄ O ₇ : 75 %, LiBO ₂ : 25 %	1
Li ₂ B ₄ O ₇ : 66,67 %, LiBO ₂ : 32,83 %, LiBr: 0,50 %	1
Li ₂ B ₄ O ₇ : 66 %, LiBO ₂ : 34 %	5
Li ₂ B ₄ O ₇ : 59 %, LiBO ₂ : 30,6%, LiF: 10 %	1

C.2 Flux-to-sample ratio

Flux-to-sample ratio, by mass	< 1,0	1,0 to 1,9	2,0 to 2,9	3,0 to 3,9	4,0 to 4,9	5,0 to 5,9	6,0 to 6,9	7,0 to 7,9	8,0 to 8,9	9,0 to 9,9	10	15,7
Number of laboratories	2	0	2	4	10	4	5	2	1	2	1	1

C.3 Fusion temperature

Range of fusion temperature, °C	< 1 050	1 050 to 1 100	> 1 100
Laboratories	5	25	4

C.4 Background correction

Background correction	Applied	Not applied
Laboratories	4	22

C.5 Correction for inter-element effect

Correction for inter-element effect	Applied	Not applied
Laboratories	13	21

Annex D (informative)

Other international inter-laboratory round-robin analyses of cement

D.1 General

The ISO round robin was a method performance study conducted under close to optimum conditions with clear calibration and measurement guidelines. This is conducive to producing “best practice” values representative of the ideal situation.

However, ISO 29581-2 is intended for use under everyday conditions in laboratories that operate to “good practice”. In order to compare the performance of laboratories in the more general scenario, this Annex sets out the results of some international round robins carried out by a large number of laboratories. Generally around 60 laboratories participated in a range of standardized chemical and physical tests, although not all participated in all of the tests. Whilst most of the chemical analyses would have been undertaken using x-ray fluorescence methods, there is no record of which tests used pressed pellets or fused beads. Other wet chemical or other instrumental methods might equally have been used.

Clearly, these results are not directly comparable to the ISO round robin but they do put into context the performance criteria when applied to routine analyses. The criteria proposed in ISO 29581-2:—, Table 2, for “expert” and “normal” performance analyses are used to segregate other “outlier” results. Mean analyses and reproducibility standard deviations are calculated after excluding these “outliers”.

D.2 Accuracy limits for validation

The proposed values from ISO 29581-2:—, Table 2, are given in Table D.1.

Table D.1 — Accuracy limits for validation of laboratory performance

Content of element species % absolute	Accuracy limit: “normal” performance % absolute	Accuracy limit: “expert” performance % absolute
0 to 0,49	0,05	0,02
0,50 to 0,99	0,08	0,03
1,00 to 6,99	0,20	0,08
7,00 to 14,99	0,30	0,12
15,00 to 29,99	0,38	0,15
30,00 to 49,99	0,50	0,20
50,00 to 79,99	0,63	0,25
80,00 to 100	0,75	0,30

D.3 Results of analyses

Results of analyses of Portland cement (CEM I), Portland-limestone cement (CEM II/A-LL) and Portland-slag cement (CEM II/A-S) carried out between April 2006 and January 2007 are summarized in Tables D.2 to D.4.

Table D.2 — Analyses of Portland cement, CEM I — April 2006 round robin

Parameter	SiO ₂ %	Al ₂ O ₃ %	Fe ₂ O ₃ %	CaO %	MgO %	SO ₃ %	Na ₂ O %	K ₂ O %	LOI ^a %
Reference analysis	20,57	5,11	3,27	62,06	2,68	3,59	0,25	1,28	0,97
Maximum	20,91	5,29	3,46	62,67	2,83	3,70	0,30	1,44	1,05
Minimum	20,21	4,94	3,10	61,47	2,48	3,43	0,21	1,10	0,87
S.D.	0,17	0,09	0,05	0,49	0,08	0,06	0,03	0,06	0,05
Number of laboratories	38	38	38	38	38	39	31	36	54
% rated "expert"	53	53	79	42	61	64	29	86	33
% rated "expert and normal"	82	84	95	71	79	82	58	100	67
% rated "outlier"	18	16	5	29	21	18	42	0	33

^a Loss on ignition.

Table D.3 — Analyses of Portland-limestone cement, CEM II/A-LL — October 2006 round robin

Parameter	SiO ₂ %	Al ₂ O ₃ %	Fe ₂ O ₃ %	CaO %	MgO %	SO ₃ %	Na ₂ O %	K ₂ O %	LOI ^a %
Reference analysis	19,18	5,11	2,81	66,87	1,42	3,26	0,11	0,56	8,64
Maximum	19,54	5,28	2,96	67,38	1,62	3,46	0,15	0,64	8,86
Minimum	18,84	4,95	2,66	66,37	1,22	3,07	0,06	0,48	8,39
S.D.	0,17	0,07	0,07	0,50	0,09	0,10	0,02	0,03	0,09
Number of laboratories	36	36	36	36	36	36	28	35	53
% rated "expert"	47	64	78	53	58	50	50	66	66
% rated "expert and normal"	81	78	94	69	81	86	75	89	79
% rated "outlier"	19	22	6	31	19	14	25	11	21

^a Loss on ignition.

Table D.4 — Analyses of Portland-slag cement, CEM II/A-S — January 2007 round robin

Parameter	SiO ₂ %	Al ₂ O ₃ %	Fe ₂ O ₃ %	CaO %	MgO %	SO ₃ %	Na ₂ O %	K ₂ O %	LOI ^a %
Reference analysis	22,79	6,17	2,89	58,51	3,52	3,33	0,25	1,30	1,46
Maximum	23,11	6,34	2,99	59,14	3,72	3,52	0,29	1,43	1,64
Minimum	22,46	6,00	2,70	58,00	3,39	3,13	0,22	1,22	1,27
S.D.	0,18	0,09	0,07	0,28	0,08	0,10	0,02	0,04	0,08
Number of laboratories	37	37	37	36	35	39	28	34	54
% rated "expert"	41	51	65	50	60	36	50	91	70
% rated "expert and normal"	70	86	89	83	83	72	71	94	87
% rated "outlier"	30	14	11	17	17	28	29	6	13

^a Loss on ignition.

D.4 Considerations

The results indicate that

- the ability to achieve the proposed analytical performance is not affected by cement type;
- a high proportion of laboratories were able to meet the performance associated with certain analytical constituents, e.g. Fe_2O_3 and K_2O ;
- a lower proportion of laboratories were able to meet the performance associated with Na_2O (low concentration of a light element) and CaO (highest concentration).

These considerations suggest that the performance validation levels proposed in ISO 29581-2 for high and low constituent concentrations should be re-considered in relation to "normal" performance laboratories.

Annex E (informative)

Acknowledgements

We express our deep appreciation for the cooperation and understanding of the participating laboratories and all persons concerned with this inter-laboratory testing programme.

We are indebted to the Technical Committee on chemistry of cement, Japan Cement Association, for the initiation, management and first report of this programme.

Members of the committee as of April 2006 were:

Chairman

Shunsuke Hanehara	Taiheiyo Cement Corporation	(to 2005)
Hisashi Inokawa	Sumitomo Osaka Cement Co., Ltd.	(from May 2005)

Members

Masashi Osaki	Ube-Mitsubishi Cement Research Institute Corporation, Ube Center
Hiroshi Hirao	Taiheiyo Cement Corporation
Noriyuki Arano	Denki Kagaku Kogyo Kabushiki Kaisha
Daihachi Kitayama	Tokuyama Corporation
Kenichi Shimosaka	Ube-Mitsubishi Cement Research Institute Corporation, Saitama Center

Secretaries

Shigeru Takahashi	Japan Cement Association
Hiroyuki Anzai	Japan Cement Association
Naoki Aoki	Japan Cement Association

Other international inter-laboratory testing

We are grateful to the HeidelbergCement Technical Center for allowing us to include the data from their international cement testing performance reviews.

BSI - British Standards Institution

BSI is the independent national body responsible for preparing British Standards. It presents the UK view on standards in Europe and at the international level. It is incorporated by Royal Charter.

Revisions

British Standards are updated by amendment or revision. Users of British Standards should make sure that they possess the latest amendments or editions.

It is the constant aim of BSI to improve the quality of our products and services. We would be grateful if anyone finding an inaccuracy or ambiguity while using this British Standard would inform the Secretary of the technical committee responsible, the identity of which can be found on the inside front cover. Tel: +44 (0)20 8996 9000. Fax: +44 (0)20 8996 7400.

BSI offers members an individual updating service called PLUS which ensures that subscribers automatically receive the latest editions of standards.

Buying standards

Orders for all BSI, international and foreign standards publications should be addressed to Customer Services. Tel: +44 (0)20 8996 9001. Fax: +44 (0)20 8996 7001 Email: orders@bsigroup.com You may also buy directly using a debit/credit card from the BSI Shop on the Website <http://www.bsigroup.com/shop>

In response to orders for international standards, it is BSI policy to supply the BSI implementation of those that have been published as British Standards, unless otherwise requested.

Information on standards

BSI provides a wide range of information on national, European and international standards through its Library and its Technical Help to Exporters Service. Various BSI electronic information services are also available which give details on all its products and services. Contact Information Centre. Tel: +44 (0)20 8996 7111 Fax: +44 (0)20 8996 7048 Email: info@bsigroup.com

Subscribing members of BSI are kept up to date with standards developments and receive substantial discounts on the purchase price of standards. For details of these and other benefits contact Membership Administration. Tel: +44 (0)20 8996 7002 Fax: +44 (0)20 8996 7001 Email: membership@bsigroup.com

Information regarding online access to British Standards via British Standards Online can be found at <http://www.bsigroup.com/BSOL>

Further information about BSI is available on the BSI website at <http://www.bsigroup.com>

Copyright

Copyright subsists in all BSI publications. BSI also holds the copyright, in the UK, of the publications of the international standardization bodies. Except as permitted under the Copyright, Designs and Patents Act 1988 no extract may be reproduced, stored in a retrieval system or transmitted in any form or by any means – electronic, photocopying, recording or otherwise – without prior written permission from BSI.
