Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 11114-1 was prepared by the European Committee for Standardization (CEN) Technical Committee CEN/TC 23, *Transportable gas cylinders*, in collaboration with ISO Technical Committee ISO/TC 58, *Gas cylinders*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This second edition cancels and replaces the first edition (ISO 11114-1:1997), which has been technically revised. The main changes resulting from the revision of this part of ISO 11114 are

- the term “not recommended” has been replaced by “not acceptable”,
- the text has been clarified,
- a requirement for gas mixtures has been introduced.

ISO 11114 consists of the following parts, under the general title *Gas cylinders — Compatibility of cylinder and valve materials with gas contents*:

- *Part 1: Metallic materials*
- *Part 2: Non-metallic materials*
- *Part 3: Autogenous ignition test for non-metallic materials in oxygen atmosphere*
- *Part 4: Test methods for selecting metallic materials resistant to hydrogen embrittlement*

Introduction

Industrial, medical and special gases (e.g. high-purity gases, calibration gases) can be transported or stored in gas cylinders. An essential requirement of the material from which such gas cylinders and their valves are manufactured is compatibility with the gas content.

Compatibility of cylinder materials with gas content has been established over many years by practical application and experience. Existing national and international regulations and standards do not fully cover this aspect.

This part of ISO 11114 is based on current international experience and knowledge.

Where there is any conflict between this International Standard and any applicable regulation, the regulation always takes precedence.

This part of ISO 11114 has been written to be in conformity with the UN Recommendations on the Transport of Dangerous Goods: Model Regulations. When published it will be submitted to the UN Sub Committee of Experts on the Transport of Dangerous Goods with a request that it be included in the Model Regulations.

ISO 9001:2015

Gas cylinders — Compatibility of cylinder and valve materials with gas contents —

Part 1: Metallic materials

1 Scope

This part of ISO 11114 provides requirements for the selection of safe combinations of metallic cylinder and valve materials and cylinder gas content.

The compatibility data given is related to single gases and to gas mixtures.

Seamless metallic, welded metallic and composite gas cylinders and their valves, used to contain compressed, liquefied and dissolved gases, are considered.

NOTE In this part of ISO 11114 the term “cylinder” refers to transportable pressure receptacles, which also include tubes and pressure drums.

Aspects such as the quality of delivered gas product are not considered.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 9809-1, *Gas cylinders — Refillable seamless steel gas cylinders — Design, construction and testing — Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa*

ISO 10156, *Gases and gas mixtures — Determination of fire potential and oxidizing ability for the selection of cylinder valve outlets*

ISO 10297, *Transportable gas cylinders — Cylinder valves — Specification and type testing*

ISO 11114-2, *Gas cylinders — Compatibility of cylinder and valve materials with gas contents — Part 2: Non-metallic materials*

ISO 11114-3, *Gas cylinders — Compatibility of cylinder and valve materials with gas contents — Part 3: Autogenous ignition test for non-metallic materials in oxygen atmosphere*

ISO 11120, *Gas cylinders — Refillable seamless steel tubes for compressed gas transport of water capacity between 150 l and 3 000 l — Design, construction and testing*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1
competent person
person who has the necessary technical knowledge, experience and authority to assess and approve materials for use with gases and to define any special conditions of use that are necessary

3.2
acceptable
A
material/gas combination that is safe under normal conditions of use, provided that any indicated non-compatibility risks are taken into account

NOTE Low levels of impurities can affect the acceptability of some single gases or gas mixtures.

3.3
not acceptable
N
material/single gas combination that is not safe under all normal conditions of use

NOTE For gas mixtures special conditions may apply (see 6.2 and Table 1).

3.4
dry
state in which there is no free water in a cylinder under any service conditions, including at the highest expected operating pressure and at the lowest expected operating temperature

NOTE For compressed gases at, for example, 200 bar and $-20\text{ }^{\circ}\text{C}$, the maximum moisture content is not to exceed 5 ppmV, to avoid condensation of free water. For other temperatures and pressures, the maximum moisture content needed to avoid condensation of water will be different.

3.5
wet
state in which the conditions as defined for **dry** (3.4) are not met

3.6
gas mixture
combination of different single gases deliberately mixed in specified proportions

3.7
single gas
gas which does not contain deliberately added content of another gas or gases

4 Materials

4.1 General

The compatibility of most materials used to manufacture gas cylinders and valves is identified in this part of ISO 11114.

Other materials whose compatibility is not identified in this part of ISO 11114 may be used if all compatibility aspects have been considered and validated by a competent person.

4.2 Cylinder materials

The most commonly used metallic materials for cylinders are (among others) carbon manganese steel, chromium molybdenum steel, chromium molybdenum nickel steel, stainless steel and aluminium alloys, as specified in the following International Standards:

- aluminium, ISO 7866 and ISO 11118;
- steel, ISO 4706, ISO 9328-5, ISO 9809-1, ISO 9809-2, ISO 9809-3, ISO 9809-4, ISO 11118 and ISO 11120;
- aluminium alloys and stainless steel, ISO 6361-2 and ISO 15510.

4.3 Valve materials

4.3.1 General

The most commonly used metallic materials for valve bodies and internal gas wetted parts are brass and other similar copper-based alloys, carbon steel, stainless steel, nickel and nickel alloys, Cu–Be (2 %) and aluminium alloys.

4.3.2 Particular considerations

4.3.2.1 In special cases, non-compatible materials may be used for non-oxidizing gases if suitably plated, protected or coated. This may only be done if all compatibility aspects have been considered and validated by a competent person for the entire life of the valve.

4.3.2.2 Special precautions, in accordance with ISO 11114-3 (which addresses testing, not precautions per se), shall be taken for oxidizing gases as specified in ISO 10156. In this case, non-compatible materials are *not acceptable* (see 3.3) for use in valves, even if plated, protected or coated.

4.3.2.3 For cylinder valves, compatibility in wet conditions shall be considered because of the high risk of contamination by atmospheric moisture and an airborne contaminant.

NOTE Reference is made in this part of ISO 11114 to stainless steels by their commonly used AISI identification numbers, e.g. 304. For information, the equivalent grades according to EN 10088-1 are as follows:

304	1.4301
304L	1.4306 and 1.4307
316	1.4401
316L	1.4404

5 Compatibility criteria

5.1 General

Compatibility between a gas and the cylinder/valve material is affected by chemical reactions and physical influences, which can be classified into five categories:

- corrosion;
- stress corrosion cracking;
- hydrogen embrittlement;

- generation of dangerous products through chemical reaction;
- violent reactions, such as ignition.

Non-metallic components (valve sealing, gland packing, O-ring, etc.) shall be in accordance with ISO 11114-2.

Sealing or lubricating materials (when used) at the valve stem shall be compatible with the gas content.

NOTE Annex A gives the gas/materials NQSAB compatibility codes, for information.

5.2 Corrosion

Many types of corrosion mechanisms can occur due to the presence of the gas, as outlined in 5.2.1 to 5.2.3.

5.2.1 Corrosion in dry conditions

This corrosion is affected by chemical attack by a dry gas on the cylinder material. The result is a reduction of the cylinder wall thickness. This type of corrosion is not very common, because the rate of dry corrosion is very low at ambient temperature.

5.2.2 Corrosion in wet conditions

This corrosion is the most common type of corrosion, which only occurs in a gas cylinder due to the presence of free water or aqueous solutions. However with some hygroscopic gases (e.g. HCl, Cl₂) corrosion would occur even if the water content were less than the saturation value. Therefore, some gas/material combinations are not recommended, even if inert in the theoretical dry conditions. It is thus very important to prevent any water ingress into gas cylinders. The most common sources of or reasons for water ingress are

- a) the customer, by retro-diffusion/backfilling or when the cylinder is empty, by air entry, if the valve is not closed,
- b) ineffective drying following hydraulic testing, and
- c) during filling.

In some cases it is very difficult to completely prevent water ingress — particularly when the gas is hygroscopic (e.g. HCl, Cl₂). In cases where the filler cannot guarantee the dryness of gas and cylinder, a cylinder material which is compatible with the wet gas shall be used, even if the dry gas is not corrosive.

There are several different types of “wet corrosion” in alloys:

- a) general corrosion leading to the reduction of the wall thickness, e.g. by acid gases (CO₂, SO₂) or oxidizing gases (O₂, Cl₂);
- b) localized corrosion, e.g. pitting corrosion or grain boundary attack.

Additionally, some gases, even inert ones, when hydrolysed could lead to the production of corrosive products.

5.2.3 Corrosion by impurities

Gases which themselves are inert (non-corrosive) can cause corrosion due to the presence of impurities. Pollution of gases can occur, during filling, during use or if the initial product is not properly purified.

The most common pollutants are

- a) atmospheric air, in which case the harmful impurities can be moisture (see also 5.2.2) and oxygen (e.g. in liquefied ammonia);

- b) aggressive products contained in some gases, e.g. H₂S in natural gas;
- c) aggressive traces (acid, mercury, etc.) remaining from the manufacturing process of some gases.

The materials compatible with the impurities shall be used if the presence of these impurities cannot be prevented and if the corresponding corrosion rate is unacceptable for the intended application.

5.3 Hydrogen embrittlement phenomenon

Embrittlement caused by hydrogen can occur at ambient temperature in the case of certain gases and under service conditions which stress the cylinder or valve material.

This type of stress cracking phenomenon can, under certain conditions, lead to the failure of gas cylinders and/or valve components containing hydrogen, mixtures of hydrogen and other gases.

5.4 Generation of dangerous products

In some cases reactions of a gas with a metallic material can lead to the generation of dangerous products. Examples are the possible reactions of C₂H₂ with copper alloys containing more than 65 % copper and of CH₃Cl in aluminium alloy cylinders.

5.5 Violent reactions (e.g. ignition)

In principle, violent reactions of gas/metallic material are not very common at ambient temperatures, because high activation energies are necessary to initiate such reactions. In the case where a combination of non-metallic and metallic materials is used, e.g. for valves, this type of reaction can occur with some gases (e.g. O₂, Cl₂).

5.6 Stress corrosion cracking

Stress corrosion cracking can occur in many metallic materials subjected to stress, moisture and a contaminant at the same time. Stress corrosion cracking can, under certain conditions, lead to the failure of the gas cylinder or valve and/or its components (e.g. ammonia in contact with copper alloy valves or carbon monoxide/carbon dioxide mixtures in steel cylinders).

6 Material compatibility

6.1 Table of compatibility for single gases (see Table 1)

Before any gas/cylinder/valve combination is chosen a careful study of all the *key compatibility characteristics* given in Table 1 shall be made. Particular attention shall be paid to any restrictions, which shall be applied to acceptable materials.

NOTE The gases are generally listed in the table in English alphabetical order.

6.2 Compatibility for gas mixtures

Any gas mixtures containing single gases that are all compatible with a given material shall be considered as being compatible with this material.

For gas mixtures containing gases causing embrittlement (see 5.3, and Table A.3, groups 2 and 11) the risk of hydrogen embrittlement only occurs if the partial pressure of the gas is greater than 5 MPa (50 bar) and the stress level of the cylinder material is high enough. Some International Standards, such as ISO 11114-4, specify test methods for selecting appropriate steels with a maximum UTS (ultimate tensile strength) greater than 950 MPa.

ISO 11114-1:2012(E)

NOTE In a gas mixture, the partial pressure for hydrogen sulphide and methyl mercaptan is reduced to 0,25 MPa (2,5 bar) at a maximum UTS of 950 MPa.

For non-compatibility of some halogenated gases with aluminium alloys, the maximum acceptable content is given in Table 1. The level of moisture can affect the acceptability of such mixtures.

6.3 Using Table 1

6.3.1 Conventions and numbers

In Table 1, **bold face** type indicates that the material is commonly used under normal service conditions:

- A = acceptable (see 3.2);
- N = not acceptable (see 3.3).

If there is no UN number listed for a gas (or liquid), the gas has no official UN number but may be shipped using a generic NOS (not otherwise specified) number.

EXAMPLE Compressed gas, flammable, NOS, UN 1954.

6.3.2 Abbreviations for materials

- CS Carbon steels used for the manufacture of cylinder valve bodies
- NS Carbon steels heat treated by normalization that are used for the manufacture of seamless and welded cylinders
- QTS Alloy steels that are treated by quenching and tempering and that are used for the manufacture of seamless steel cylinders
- SS Austenitic type stainless steels used for the manufacture of seamless and welded cylinders and some valve bodies and valve components
- AA Aluminium alloys specified in ISO 7866 when used for the manufacture of seamless cylinders. For aluminium valve bodies, alloys not specified in ISO 7866 may also be used
- B Brass and other copper alloys used for the manufacture of cylinder valves
- Ni Nickel alloys used for the manufacture of cylinders, valves and valve components
- Cu Copper
- ASB Aluminium silicon bronze

Table 1 — Gas/material compatibility

16	(UN 1013)	CARBON DIOXIDE	CO_2	No reaction with common materials when dry. Forms acidic carbonic in the presence of water; corrosive for NS, QTS and CS. Risk (for NS and QTS) of stress corrosion cracking in presence of CO (see carbon monoxide) and water.	NS QTS AA SS			B CS SS AA		

Table 1 (continued)

No.	Gas number UN number	Name	Formula	Key compatibility characteristics	Material			
					Cylinder		Valve (body and components)	
					A	N	A	N
17	(UN 1016)	CARBON MONOXIDE	CO	Risk of formation of toxic metal carbonyls. Highly sensitive to any traces of moisture [>5 ppmV at 20 MPa (200 bar)], in the presence of CO_2 (>5 ppmV). Industrial grades of carbon monoxide normally contain traces of CO_2 . This can result in risk of stress corrosion cracking, in the case of QTS, CS and NS cylinders if used at the normal service stress levels. Experience shows that this risk is eliminated if the fill pressure at 15°C is less than 50 % of the cylinder working pressure. For details, see [9] in the Bibliography. For QTS, CS, and NS steels this risk of stress corrosion cracking shall be considered for mixtures containing down to 0,1 % CO. NOTE AA and SS are not affected by this stress corrosion cracking phenomenon.	NS QTS AA SS		B CS SS AA	
18	(UN 1982)	TETRAFLUORMETHANE (CARBON TETRAFLUORIDE)	CF_4 (R14)	No reaction with any common materials when dry, but in the presence of water corrosion can occur.	NS QTS AA SS		B CS SS AA	
19	(UN 2204)	CARBONYL SULPHIDE	COS	Risk of formation of toxic metal carbonyls at temperature $> 100^\circ\text{C}$. Highly sensitive to any traces of moisture (>5 ppmV), in the presence of CO_2 (>5 ppmV); industrial grades of carbonyl sulphide normally contain traces of CO_2 . This results in a risk of stress corrosion cracking, in the case of QTS, NS and CS. See also CO (No.17).	NS QTS AA SS		B CS SS AA	
20	(UN 1017)	CHLORINE	Cl_2	Hydrolyses to hypochlorous acid and to hydrogen chloride in contact with moisture. In wet conditions, see specific risk of hydrogen chloride compatibility, i.e. severe corrosion of most of the materials and risk of hydrogen embrittlement. The service life of brass valves strongly depends on the operating service conditions.	NS QTS SS	AA	B CS SS Ni ASB	AA

Annex A (informative)

Gas/materials NQSAB compatibility code

A.1 General

A five-digit code allows a rating of the compatibility of each gas with five different classes of materials for use with gas cylinders and cylinder valves. This is termed the NQSAB code, where “N” represents normalized steels and carbon steels, “Q” quenched and tempered steels, “S” stainless steels, “A” aluminium alloys and “B” brass and other copper alloys, and nickel alloys. The degree of compatibility is identified by replacing the letter with the appropriate digit as described in A.2.

A.3 presents the NQSAB code itself, and in A.4 the gases covered in this part of ISO 11114 are divided into 11 groups, depending on their compatibility with cylinder and valve materials.

A.2 Material classes and compatibility identification

A.2.1 Normalized steels and carbon steels (N)

- 0 Not acceptable.
- 1 Acceptable but check Table 1, key compatibility characteristics.
- 9 Acceptable but check Table 1, key compatibility characteristics, to avoid hydrogen embrittlement.

A.2.2 Quenched and tempered steels (Q)

- 0 Not acceptable.
- 1 Acceptable but check Table 1, key compatibility characteristics.
- 9 Acceptable but check Table 1, key compatibility characteristics, to avoid hydrogen embrittlement.

A.2.3 Stainless steels (S)

- 0 Not acceptable.
- 1 Acceptable for gas cylinder but check Table 1, key compatibility characteristics.
- 2 Pitting corrosion can be minimized by using stainless steel alloys such as 316.
- 9 Hydrogen embrittlement can be minimized by using stainless steel alloys such as 316.

A.2.4 Aluminium alloys (A)

- 0 Not acceptable but some mixtures of dry gases may be filled into AA; check Table 1, key compatibility characteristics.
- 1 Acceptable but check Table 1, key compatibility characteristics.

A.2.5 Brass and other copper alloys (B)

- 0 Not acceptable.
- 1 Acceptable to be used but check Table 1, key compatibility characteristics.
- 3 Use brass or other copper alloys containing less than 65 % Cu.

A.3 NQSAB code

The NQSAB code for each gas is given in Table A.1. For gases where the compatibility rating 2, 3 or 9 are specified, refer also to Table 1.

Table A.1 — List of gases with corresponding NQSAB compatibility code

Name and gas number	Formula	N	Q	S	A	B
1 ACETYLENE	C ₂ H ₂	1	1	1	1	3
2 AMMONIA	NH ₃	1	1	1	1	0
3 ARGON	Ar	1	1	1	1	1
4 ARSINE	AsH ₃	9	9	9	1	1
5 BORON TRICHLORIDE	BCl ₃	1	1	2	0	0
6 BORON TRIFLUORIDE	BF ₃	1	1	2	0	0
7 BROMOCHLORODIFLUOROMETHANE	CBrClF ₂ (R12B1)	1	1	1	1	1
8 BROMOTRIFLUOROMETHANE	CBrF ₃ (R13B1)	1	1	1	1	1
9 BROMOTRIFLUOROETHYLENE	C ₂ BrF ₃	1	1	1	1	1

Table A.1 (continued)

Name and gas number	Formula	N	Q	S	A	B
10 BUTADIENE-1,3	$H_2C:CHCH:CH_2$	1	1	1	1	1
11 BUTADIENE-1,2	$H_2C:C:CHCH_3$	1	1	1	1	1
12 BUTANE	C_4H_{10}	1	1	1	1	1
13 BUTENE-1	$CH_3CH_2CH:CH_2$	1	1	1	1	1
14 BUTENE-2 (CIS)	$CH_3CH:CHCH_3$	1	1	1	1	1
15 BUTENE-2 (TRANS)	$CH_3CH:CHCH_3$	1	1	1	1	1

104 XENON	Xe	1	1	1	1	1

A.4 Groups of gases

Single gases are grouped by their compatibility with cylinder and valve materials, as follows:

Group 1: Gases compatible with all materials (code 11111).

Group 2: Gases compatible with all materials but where the risk of hydrogen embrittlement has to be considered (code 99911).

Group 3: Gases compatible with all materials but requiring alloys containing less than 65 % of copper (code 11113).

Group 4: Gases compatible with all materials but 316 type stainless steels recommended (code 11211).

Group 5: Gases compatible with all materials except brass (code 11110).

Group 6: Gases compatible with all materials except brass and 316 type stainless steels recommended (code 11210).

Group 7: Gases compatible with all materials except aluminium (code 11101).

Group 8: Gases compatible with all materials except aluminium and 316 type stainless steels recommended (code 11201).

Group 9: Gases compatible with all materials except aluminium and brass and 316 type stainless steels recommended (code 11200).

Group 10: Gases compatible with all materials except aluminium, 316 type stainless steels recommended and alloys containing less than 65 % of copper (code 11203).

Group 11: Gases compatible with all materials except aluminium and brass and 316 type stainless steels recommended to consider the risk of hydrogen embrittlement (code 99200).

NOTE *All materials* means materials covered in this part of ISO 11114.

Group 1			
These gases are compatible with all materials (Code 11111).			
No.	Gas name	No.	Gas name
3	Argon	47	Ethylene
7	Bromotrifluoroethylene	48	Ethylene oxide
8	Bromotrifluoromethane	50	Fluoroethane
9	Bromotrifluoromethylene	51	Fluoromethane
10	Butadiene-1,3	52	Trifluoromethane
11	Butadiene-1,2	54	Helium
12	Butane	55	Hexafluoroethane
13	Butene-1	56	Hexafluoropropene
14	Butene-2 (cis)	60	Hydrogen cyanide
15	Butene-2 (trans)	64	Isobutane
16	Carbon dioxide	65	Isobutylene
17	Carbon monoxide	66	Krypton
18	Carbon tetrafluoride	67	Methane
19	Carbonyl sulphide	73	Neon
21	Chlorodifluoromethane	75	Nitrogen
23	Chloropentafluoroethane	77	Nitrous oxide
24	Chlorotetrafluoroethane	78	Nitrogen trifluoride
25	Chlorotrifluoroethane	79	Octofluorobut-2-ene
26	Chlorotrifluoroethylene	80	Octafluorocyclobutane
27	Chlorotrifluoromethane	81	Octafluoropropane
28	Cyclopropane	82	Oxygen
30	Dibromodifluoromethane	85	Propane
31	Dibromotetrafluoroethane	86	Propadiene
33	Dichlorodifluoromethane	87	Propylene
34	Dichlorofluoromethane	88	Propylene oxide
36	Dichlorotetrafluoroethane	92	Sulphur dioxide
38	1,1-Difluoro-1-chloroethane	93	Sulphur hexafluoride
39	1,1-Difluoroethane	95	Tetrafluoroethylene
40	1,1-Difluoroethylene	97	Trichlorotrifluoroethane
42	Dimethyl ether	98	1,1,1-Trifluoroethane
44	Ethane	104	Xenon

Group 2	
These gases are compatible with all materials, but the risk of hydrogen embrittlement shall be considered (code 99911).	
No.	Gas name
4	Arsine
29	Deuterium
32	Diborane
43	Disilane
53	Germane
57	Hydrogen
63	Hydrogen sulphide
70	Methyl mercaptan
71	Methyl silane
84	Phosphine
89	Silane

Group 3	
These gases are compatible with all materials, but require alloys containing less than 65 % of copper (code 11113).	
No.	Gas name
1	Acetylene
68	Propyne

Group 4	
This gas is compatible with all materials, but 316 type stainless steels is recommended (code 11211).	
No.	Gas name
60	Hydrogen cyanide

Group 5	
These gases are compatible with all materials except brass (code 11110).	
No.	Gas name
2	Ammonia
41	Dimethylamine
45	Ethylamine
72	Methylamine
99	Trimethylamine

Group 6	
These gases are compatible with all materials except brass, and 316 type stainless steels are recommended (code 11210).	
No.	Gas name
37	Cyanogen
74	Nitric oxide
76	Nitrogen dioxide

Group 7	
These gases are compatible with all materials except aluminium (code 11101).	
No.	Gas name
22	Chloromethane
46	Ethyl chloride

Group 8	
These gases are compatible with all materials except aluminium, and 316 type stainless steels are recommended (code 11201).	
No.	Gas name
20	Chlorine
49	Fluorine
69	Methyl bromide
83	Phosgene
90	Silicon tetrachloride
91	Silicon tetrafluoride
94	Sulphur tetrafluoride
96	Trichlorosilane
100	Tungsten hexafluoride

Group 9	
These gases are compatible with all materials except aluminium, and brass and 316 type stainless steels are recommended (code 11200).	
No.	Gas name
5	Boron trichloride
6	Boron trifluoride
35	Dichlorosilane

Group 10	
These gases are compatible with all materials except aluminium, and 316 type stainless steels and alloys containing less than 65 % of copper are recommended (code 11203).	
No.	Gas name
101	Vinyl bromide
102	Vinyl chloride
103	Vinyl fluoride

Group 11	
These gases are compatible with all materials except aluminium and brass, and 316 type stainless steels are recommended to consider the risk of hydrogen embrittlement (code 99200).	
No.	Gas name
58	Hydrogen bromide
59	Hydrogen chloride
61	Hydrogen fluoride
62	Hydrogen iodide
